IV. THE INROAD OF RATIONALISM. (1) *Its incipient advance.*—In the next generation the fervor of pietism had abated. The diligent study of scriptural truth was exchanged for passive assent to it. Spener had endeavored to unite reason and faith; but his followers, renouncing reason, clung to faith alone. In this way pietism unintentionally, but really, exerted an influence against the orthodox system of doctrines by attaching great importance to the Bible alone as opposed to creeds, and to the witness of the Spirit as opposed to the written word. Zeidler, an eminent minister at Leipzig, honoring the Bible, treated systems of doctrine with contempt. Some fervent mystics, in their zeal for the 'inner word,' spoke lightly of inspiration and atonement. Some insisted simply on Christian love and morality, heedless of danger from the assaults of false teachers. Koch (1754) lamented the low esteem into which the Bible had fallen among all classes of society. This pressure against orthodox doctrine at home was strengthened by influences coming from England and Holland, the force of which may be estimated by the opposition at first made to it, as indicated by the fact that, within 40 years, nearly 90 works were published against various phases of unbelief. (2) *The period of historical criticism.*—At the middle of the eighteenth century German theology was in a rigid and shallow condition. The contest between pietism and formal orthodoxy had ceased. The second generation of professors at Halle had gone. The old defenders of orthodoxy had disappeared. Then the era of historical criticism was ushered in. New investigations were begun; antiquity, literature, science, were diligently explored; the

circle of religious beliefs was thrown open for re-examination. On this field also English deists had already been at work. In Germany, Semler of Halle led the advance, obscuring the old orthodox landmarks, assailing the text of the Bible, denying the relevancy of standard proof-texts, disputing the genuineness of many biblical books, and undermining usages and doctrines which hitherto all had received. The vigor of critical examination thus awakened spread rapidly among the universities and the clergy. It was employed on biblical criticism and exegesis, Church history, and the history of doctrine. To the authority of the Church Semler, indeed, held fast, but in a singular manner, affirming that the symbols and forms are useful in preserving external unity and uniformity. His great error was in supposing that religion can exist without a doctrinal foundation. Beginning with the warmth of pietism around him, he gradually abandoned all reverence for the Scriptures. Regarding the inner conviction of a truth-loving human heart as the only test of the inspiration of a book, he rejected Ruth, Ezra, Nehemiah, Esther, and the Canticles; questioned the genuineness of Joshua, Judges, Samuel, Kings, and Daniel; and slighted the Pentateuch as a collection of legendary fragments. The New Testament, he thought, was better than the Old, yet some of its parts he condemned as positively evil. The Apocalypse he rejected as the work of a fanatic; the Gospel of John he distinguished as the only one useful for the modern Church. He asserted that Christ and the Apostles taught many things in mere accommodation to the prejudices of the age. The doctrines of the Bible Semler vigorously attacked. What he did at Halle, other men did in different parts of Germany. Two writers, especially, carried out their principles both in their books and in their lives. Edelman constructed his theological system in answer to the question, *What is useful? not What is true?*—that is, what is seen to be useful? Consequently, beginning with very slight departures from orthodoxy, he reduced Christianity, at last, to a weak form of deism. Bahrdt went much further, ridiculing the Bible, blaspheming Christ, and, by his immoral life, making the very name of theologian infamous. Yet he stands as the turning-point of vulgar rationalism. It had become manifest that criticism, if left to itself, would produce only destruction. This compelled the search for something that would avert the fall. At the opening of the nineteenth century the Scriptures, rationally interpreted, were still regarded as teaching a rational religion. But as the historical exegesis had advanced, the chasm had widened between the traditional and the rational sense. The accommodation theory was increasingly applied to every portion of the Bible, and at length the mythical theory began to appear. Baur, in 1824, published a Hebrew mythology of the Old and New Testaments, in which the miracles were explained away as merely natural events. (3) *The connection of rationalism with philosophy.*—The work of preparation for rationalism had at first been prompted by the demands of what was called 'the sound human understanding'; but after the opening of the eighteenth century the aid of philosophy also was sought. Wolff proposed a division of theology into natural and revealed; and as natural

theology could give the reason for the facts which it affirmed, and revealed could not, emphasis was put chiefly on the former. After the decline of Wolff's popularity, the criticism of Semler and his followers seemed harmonious enough with the eclectic system which, for a time, prevailed; for both the criticism and the philosophy were in accordance with the demands of 'the sound human understanding.' But Kant's philosophy assailed both. Some of the rationalists, indeed, claimed it as favorable to them; others slighted it as unintelligible; but a few more discerning men saw that the new would overturn the old. When the speculative systems of Fichte and Schelling appeared, they despised the reasonings of 'the sound human understanding,' and slighted the best principles of rationalism as commonplace and vulgar. And rationalism, on its part, shrinking back from the new atheism, wrote strongly against it. In the faith-philosophy of Jacobi the rationalists thought they could find refuge. Their scheme hitherto had allowed no scope to sentiment and the heart. A mere probability was its highest word for the essential truths. The system of Jacobi met this difficulty, since to the intellectual probability it added the certainty of feeling. Therefore the better class of rationalists welcomed it. With this rose also the supernaturalist school, including those who denied the absolute rule of reason in matters of religion; and, though many of them were deficient in reverence for the Bible, they were at least travelers in an upward path. Hegel and his followers professed to present the pure and final rendering of that which Christianity gives in a popular form—to vindicate philosophically the Trinity, the atonement, and the other doctrines of the orthodox creed, and to refute the rationalism which had impugned these mysteries. This claim Strauss, in his life of Jesus, utterly denied. Treating the Gospels as a narrative of merely natural events, he asserted that Jesus, a devout man, impelled, like other Jews, by the preaching of John the Baptist, made confession of sin, and was baptized. Afterwards, proclaiming Himself as the promised Messiah, by His courage, activity, and purity of life, He won the good opinion of many, especially of the common people, and attached to Himself a company of devoted disciples; but having, by His scathing rebukes of hypocrisy, kindled the enmity of the priests and Pharisees, He was, by their influence, put to death on the cross. The wonderful works of beneficence and power with which the narrative was adorned were only fanciful inventions of His disciples, which ultimately came to be regarded as facts. This historical Jesus Strauss strove to transform into an ideal character, and affirmed that the God-man is to be looked for not in any one person, but in the human race as a whole. At a later period he was driven to admit for a time that the life of Jesus was extraordinary; that Jesus Himself had controlling power over the minds of men, and perhaps over physical disease; that "in Him must be recognized the highest that can be known or thought in religious things; that without Him present in the mind no complete piety is possible, so that the substance of Christianity is in Him preserved to us." But these admissions he later withdrew.

V. RETURN TO EVANGELICAL DOCTRINE. As the way for the prevalence of rationalism had been opened through the decline of practical religion, so the return to evangelical doctrine was effected by a revival of personal piety. While Semler was striving to disintegrate faith in the Scriptures, as well as the Scriptures themselves, Klopstock wrote and published his *Messiah*, which was spread over every part of Germany and among all classes, awakening admiration, and kindling devotion. About the same time, Hamann, a young German, after vainly seeking relief in folly and vice from the effects of disappointment, retired to a remote part of London, obtained a Bible, and read it carefully. With a revulsion of feeling, he entered at once on a new course. His writings and genius soon procured him friends in his own country, and gave him influence over the noble, the gifted, and the rich, by which they, as well as men of humbler life, were won to the Christian faith. Herder, contemporary with both Klopstock and Hamann, in his *Spirit of Hebrew Poetry*, gave attention particularly to the literary and human elements of the Bible as, in his opinion, strengthening its claims to a divine origin. He pointed out, critically, its poetical beauties, not as if they were ornaments only, but as springing from the heart of the revelation, and forming an essential accompaniment of inspiration. He wrote also on the New Testament, treating of the Pentecostal gift of tongues, the Resurrection, the Redeemer in the three Gospels, the Son of God as the Saviour of the world, and the spirit of Christianity. While imparting elevated views of the Scriptures, he labored also to exalt the pastor, considering that his true place was by the side of the old prophets, and that no man was worthy of the office who neglected the particular care of souls. He was himself, in many respects, a model preacher. While the three distinguished men above mentioned were in the midst of their active work, Schleiermacher was born, who has been called the greatest divine of the nineteenth century, and to whose influence for good scarcely any limit can be assigned. In his fifteenth year he was sent to a Moravian school, whence he brought a personal devotion to Christ. His *Discourses to Unbelievers of Cultivated Minds* (1799) marked at once the opening of a new century and of a new era in religion. In 1789 David Mendel was born of poor Jewish parents, his father a peddler, his mother an intelligent and pious woman. At Hamburg he was assisted in acquiring an education, and soon won the respect of teachers and scholars by his talents, while he excited also their merriment by the oddity of his appearance and the awkwardness of his manner. When Schleiermacher's *Discourses* were published, Mendel was one of the multitudes awakened by them, and in 1806, renouncing Judaism, he was baptized, and took the name Neander (a new man). He studied theology at Halle, where Schleiermacher was his favorite professor and deeply interested friend. In 1812 both teacher and pupil were made professors in the new university at Berlin, the former of theology, the latter of Church history. In this position Neander worked to the end of his life, and acquired, as a lecturer, vast renown. Even Schleiermacher's hearers were limited in number when compared with the crowds that came from all parts of Germany,

and the most distant Protestant countries, to hear Neander. Many Roman Catholics also were found in his classes. All the great preachers of Germany became more or less enlightened by his ideas. His salutary influence on the religious condition of the country was immeasurably great, powerfully contributing to the overthrow both of rationalism and of dead formalism, and drawing multitudes of young men to embrace the vital doctrines of Christianity. With him religion was nothing without Christ—not only apprehended by the intellect, but also loved and trusted with all the powers of the soul. In his view sin was not only injurious, but also involved guilt, and could be pardoned only through the death and mediation of Christ. In 1816 Tholuck entered the University of Berlin, where he was rescued from skepticism under the instructions of Schleiermacher and Neander, aided by the influence of a distinguished Moravian friend. In 1826 he became professor of theology at Halle as the successor of Professor Knapp, who had sincerely but timidly resisted the prevalent rationalism. Out of 900 students only five avowed their belief in the divinity of Christ; and all the professors, being rationalists, opposed Tholuck's appointment. But the number of young believers in Christ increased year by year. Many thousands of young men became Christians under his instructions. Hengstenberg (1802-69) devoted his youth chiefly to the study of philosophy and the Oriental languages; but, during a season of sickness and sorrow, having turned with great ardor to the spiritual teaching of the Bible, he became fully convinced of the divine authority of evangelical religion and of the excellence with which its truths are expressed in the Augsburg Confession. In 1826 he was made one of the professors of theology at Berlin, and from that time, for more than forty years, was a conspicuous and earnest defender of Christian doctrine, as based on the divine authority of the Scriptures. Among his numerous writings may be mentioned, as having especial influence: *Egypt and the Books of Moses*; *Commentary on the Psalms*; and *The Christology of the Old Testament*.

VI. THE LAST HALF OF THE NINETEENTH CENTURY. Four general schools of thought may be distinguished. The first, proceeding from the school of Schleiermacher and adhering to the 'union' (of the Reformed and Lutheran churches in Prussia), may be called an evangelical, conservative school, though in such representatives as Dörner and Rothe exhibiting a large degree of speculative independence. Dörner founded his system upon speculation rather than upon exegesis. Julius Müller was the next important member of this school. The second school is also conservative, but more consistent and compact, because rallying with distinct purpose around the historic confessions of the Lutheran Church. It rose in the circles in which the Lutheran protest against the 'union' was most vigorously made. Its chief seat became the University of Erlangen, where a series of able men defended it—Harless, Thomasius, Hoffmann, Frank, and Zahn. For a long time it was powerfully represented at Leipzig by Luthardt, Kahnis, Delitzsch, and their colleagues. Thomasius, formed by Schleiermacher, and influenced by Hegel, embraced the old Lutheran orthodoxy with great warmth and sincerity. He

sought to develop its Christology by the suggestion of the 'kenosis' (q.v.). Hoffmann was the great exegete of the school. Frank had more of the spirit of Luther than the others, and based his theology upon Christian experience, conceived as having its ultimate element in the new birth. Luthardt did not sympathize with these modifications. Delitzsch, with others, formed the 'New Lutheran' party, which laid great emphasis on the doctrine of the Church. The third school takes its rise from Baur, and has adhered in various degrees to the principles of Baur's historical criticism (Hilgenfeld), or has gone over to a substantial naturalism (Pfleiderer). It is most remarkable that, while the second school has still a large following among the pastors throughout Germany, in academic circles the three have all lost their leadership, except possibly at Erlangen alone, and have been almost everywhere replaced by the members of the fourth school, that of Ritschl (q.v.). Since about 1870 the Ritschlian school has been constantly upon the increase. Ritschl, having for a time been an adherent of Baur, finally came to occupy a position of his own, which may be summarily described as an effort to derive theology from the principle of the divine love, with such an emphasis upon the Christian life that elements of the doctrinal system not having evident connection with this should be excluded. The result is the great abridgment or total suppression of the supernatural element in Christianity and the excision of regeneration and eschatology. The preëxistence of Christ is declared to be of no 'interest,' and the Trinity becomes Sabellian. Ritschl was succeeded at Göttingen by Schultz, his colleague, and has his representatives now everywhere: at Bonn, Bender and his son Otto Ritschl; at Strassburg, H. H. Wendt; at Marburg, W. Herrmann; at Basel, Duhm. At Leipzig, Gregory, who has continued Tischendorf's work, is a Ritschlian. But the centre of the influence of the school is now Berlin, where Kaftan represents the right wing, approaching very close to evangelical standards in his *Dogmatik*, and repairing most of the defects and omissions of Ritschl; and Harnack the left wing, whose monumental historical work has given him the acknowledged first place in his department in the world. As defined by one of their own number, "the Ritschlian school is not a school, and embraces men of quite widely different styles of thinking, being united only in this, that it demands that a man shall love truth and seek that alone without fettering prejudices. All such it welcomes."

Consult: Dörner, *History of Protestant Theology* (trans., Edinburgh, 1871), which covers the whole field; Landerer, *Neueste Dogmengeschichte* (Altenburg, 1881), beginning with Semler; Frank, *Geschichte und Kritik der neueren Theologie* (Leipzig, 1898), beginning with Schleiermacher. Nippold and Pfleiderer have published valuable sketches of the theological history of the nineteenth century.

GERMAN TINDER. See AMADOU.

GERMANTOWN. A former suburb of Philadelphia, since 1845 included within the municipal limits. Germantown occupies a large area, about five miles to the north of the centre of the city. Its picturesque site, the superior character of its architecture, its beautiful gardens, and the large

public libraries, render it a charming place of residence. To the west is the romantic gorge of the Wissahickon; to the north is Chestnut Hill, with its fine villas. There is a large section occupied by manufacturing establishments. Germantown was settled in October, 1683, by a party of Germans, four of whom in 1688 made the first formal protest ever made in America against slaveholding. The first paper-mill in America was erected here in 1690, and here also, in 1743, the first American edition of the Bible, in any language, was printed. Germantown is chiefly notable in history for the battle which was fought here on October 4, 1777, between the Americans under Washington and the British and Hessians under Howe. Washington opened the engagement at daybreak on the 4th. At first his centre and left, under Sullivan and Greene respectively, forced back the opposing British and Hessians, and victory for a time seemed assured; but Stephen, on Greene's right, through a dense fog, mistook the American left centre under Wayne for the enemy, and opened fire, while a body of English, who had taken refuge in a large stone house, the residence of Judge Chew, in the rear, detained a part of the American forces. Stephen's accident, coupled with the continual firing in the rear, threw the American troops into confusion, but Washington led them from the field in perfect order. The British loss was 575; the American, 673. Washington's apparent audacity in attacking Howe so soon after the battle of Brandywine (q.v.) greatly encouraged the army and the people, and, together with Gates's success at Saratoga, led the hitherto wavering French Court to form an alliance with the United States. For a contemporary sketch of the founding of Germantown, consult: Pastorius, "Geographical Description of Pennsylvania," in *Pennsylvania Historical Society Memoirs* (Pennsylvania, 1850); for references to its early history, Scharf and Westcott, *History of Philadelphia* (Philadelphia, 1884); and for brief accounts of the battle, Carrington, *Battles of the American Revolution* (New York, 1878); Dawson, *Battles of the United States* (New York, 1858); and Lossing, *Field Book of the Revolution* (New York, 1859). For a further description of Germantown, see PHILADELPHIA.

GERMANUS, SAINT (c.378-448). Bishop of Auxerre. He was born in Auxerre, 100 miles south of Paris, of an eminent family, and became learned in literature and law and distinguished for eloquence. He was military governor of his native district, afterwards Bishop of Auxerre. On being chosen Bishop (418) he separated from his wife, built a monastery, devoted his spare property to the poor, and thereafter lived a life of the severest asceticism. He visited England twice (430 and 447) for the purpose of combating Pelagianism, and on the first occasion, shortly after Easter, 430, led the Britons against a plundering party of Picts and Scots, terrifying them into a retreat by shouting 'Alleluia,' from which circumstances the event was called the 'Alleluia victory.' It was he who discovered the future patron saint of Paris, Geneviève (q.v.). His life as told is romantic, and in part miraculous. He died at Ravenna, Italy, July 31, 448. His feast occurs on July 31st. Consult his life by Viole (Paris, 1656).

GERMAN VERSION. See BIBLE.

GERMANY. An empire which takes in the central part of Europe. The main highways between the north and south and the east and west of Europe pass through it. It is in closer touch with most of the leading nations of Europe than any other country; for it is bordered by Russia, Austria-Hungary, Switzerland, France, Belgium, the Netherlands, and Denmark, and is within a day's sail, across the North Sea, of Great Britain. Besides the land boundaries formed by the seven countries above mentioned, it has a sea frontage of 1200 miles on the North and Baltic seas—one-third of the entire frontier. The country extends east and west through 17 degrees of longitude, or 750 miles; north and south through nearly 9 degrees of latitude, 47° to 56° N., or about 600 miles. Its area is 208,830 square miles. The German Empire embraces the territory of the German Confederation of 1815-66, with the exception of those portions which belonged to Austria (in a great part of which the German language predominates), as well as of Luxemburg and Liechtenstein; but with the addition of the three Prussian provinces of East Prussia, West Prussia, and Posen (not included in the old German Empire), Schleswig, and Alsace-Lorraine. Capital, Berlin.

TOPOGRAPHY. The southern two-thirds of Germany is highland; the northern third is lowland, a part of the low plain of Europe. Three topographic forms predominate in Central Europe. The most southern is the high Alps of Switzerland. North of the high Alps are the Mittelgebirge (secondary mountains) or highlands of Germany. North of the highlands is the German low plain. The highlands consist in part of high plains, rolling or hilly areas, and, in part, of short mountain chains or groups of mountains, which extend from southwest to northeast or from southeast to northwest, seldom from south to north. Only a few summits among these mountains exceed 3500 feet in height. The mountain systems inclose high plains, as, for example, the plains of Bavaria and of the Middle Rhine basin. This division of the southern part of Germany by natural barriers was a powerful influence in separating the German people into many different States, each having its own government.

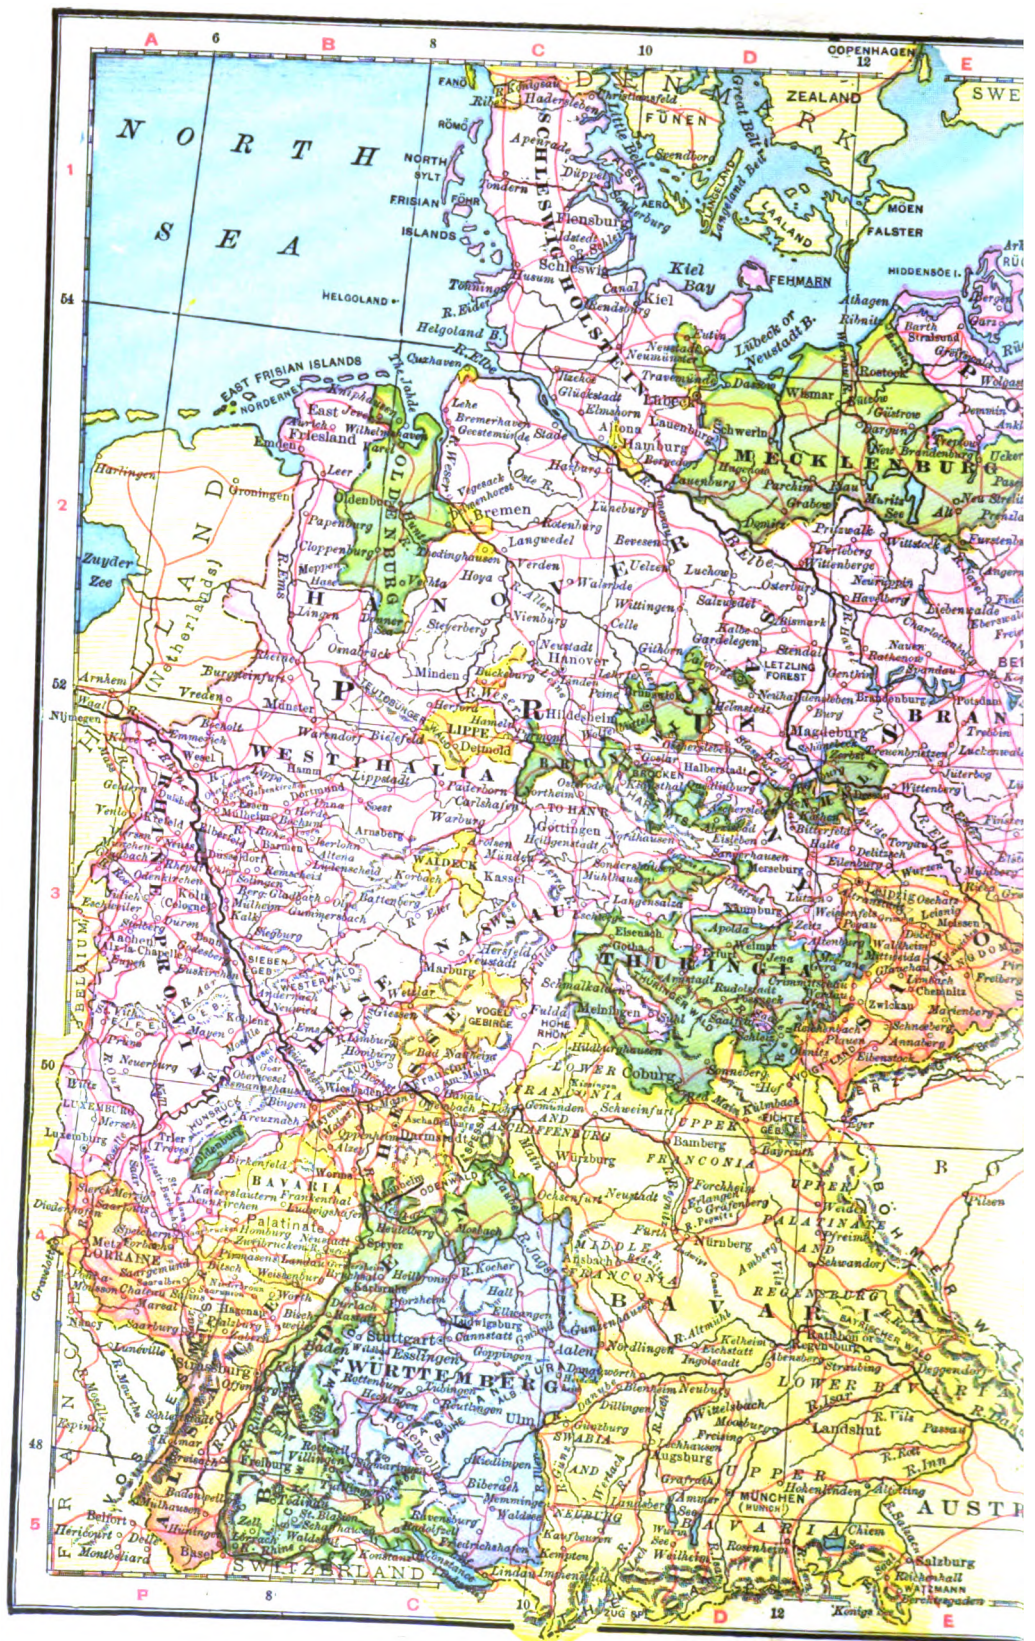

The most northern system of these mountain chains has a general east and west direction, roughly at right angles with the more southerly mountains. It extends through the middle of Germany, and forms the boundary between North and South Germany, or, in other words, between the highlands and the low plain. This zigzag boundary wall begins in the east with the Sudetic Mountains (including the Giant Mountains, or Riesengebirge), and is extended farther west by the Erzgebirge, the Fichtelgebirge, and the Thuringian Forest. The valley of the Elbe is the only break in these 390 miles of boundary mountains. Then comes the wide gap formed by the Hessian upland, broken only by the volcanic uplifts of the Rhön Mountains and the Vogelsberg. Through this break in the barrier mountains flows the Weser to the north. In the west the boundary wall rises again in the Taunus, around which is one of the finest wine regions of Germany, and, across the Rhine Valley, in the Hunsrück. Outlying elevations to the north of this wall in the

Middle Weser and Rhine basins push the highlands a little farther north in that region, and the low plain in front of them is correspondingly contracted. The culminating feature of these outliers is the Harz Mountains. The more southerly of the highlands mountains comprise among other chains or ridges the Schwarzwald, or Black Forest, the Swabian and Franconian Jura, and the Bavarian Forest. The Alps enter in the extreme south. A dominant mountain mass west of the Rhine is constituted by the Vosges. Physiographically interesting is the volcanic region, north of the Moselle, known as the Eifel. The highest point of land in the Empire is the Zugspitze, in Bavaria, 9725 feet in elevation.

In sharp contrast with the broken and divided character of the lands of South Germany is the nearly uniform low plain of the north, which merges on one side without any distinct natural boundary into the plain of Russia, and on the other into the lowlands of the Netherlands. As the course of the chief rivers shows, the whole country slopes gradually north to the Baltic, and northwest to the North Sea.

On the sea frontage there are many inlets, but few good harbors. The shore waters are quite shallow, and large vessels are usually unable to approach the land except where the rivers have worn a channel. Most of the harbors therefore are at the mouths of rivers or some distance inland on their banks. Wherever the sand-dunes along the low North Sea do not prevent the sea from breaking in, dikes have to be built for the protection of the coast. The shores of the Baltic are higher, but the commercial facilities they afford are much impaired by a series of very shallow lagoons, called Haffs, which extend parallel with the coast in front of them for long distances. The islands are not important. Rügen, in the Baltic, is the largest. Sand-dunes run along the Baltic coast in place of marsh-lands, but the North Sea dunes are now represented only by the line of the Frisian Islands, all that is left of the former coast-line, which once extended farther out into the sea. The most important North Sea ports are Hamburg, on the Elbe, and Bremen, on the Weser, together with the subsidiary ports of Bremen, Bremerhaven, and Geestemünde. The principal Baltic ports are Stettin, Danzig, Kiel, and Lübeck.

HYDROGRAPHY. With the exception of the southeastern part of Germany, through which the Danube flows to the east, all the rivers belong to the Baltic and the North Sea basins. The Rhine is the only river which binds together the three great topographic forms—the High Alps, the German highlands, and the low plain. It belongs to three countries—Switzerland, Germany, and the Netherlands. Commercially, it is the most important river in Germany, small river steamers being able to ascend to Basel, and small sea-going steamers to Mannheim. The Weser and the Elbe, the latter rising in Austria, bind together the German highlands and low plain. The Elbe is second only to the Rhine in commercial importance, being navigable throughout the whole of its course in Germany. Along its course are some of the most important silver and coal mines, salt-fields, sheep-pastures, and beet-root areas in the Empire. Besides being the greatest water commerce carrier through Central Germany from the south border to the

North Sea, it links Berlin, the capital and business centre, with Hamburg, the chief port, by the canals of the Havel and Spree river systems. The Weser is also of great importance in its lower course. The Oder and the Vistula are the chief Baltic rivers. Both rise in Austria, have only a short course in the highlands, and flow mainly through the lowland. The Oder is the great waterway of the rich mining and manufacturing district of Silesia, and of the wide farming area around Frankfort-on-the-Oder; with the canal leading to the Spree it is a highway for Berlin's commerce from Southeast Prussia to the port of Stettin. The lower part of the Vistula is German, but it carries a great deal of Russian timber, grain, and fibres to Danzig for export. Among other important streams are the Ems, flowing into the North Sea, the Main and the Moselle, affluents of the Rhine, the Pregel and Memel, flowing into the Baltic, and the Saale, an affluent of the Elbe. The rivers of Germany are naturally navigable for nearly 6000 miles; are canalized for nearly 1400 miles; and there are nearly 1500 miles of canals. Among the most important of the canals are the Ludwigskanal in Bavaria, uniting the Danube with the Main, and thus supplying a continuous waterway from the North to the Black Sea; the system connecting the Memel with the Pregel; that joining the Oder with the Elbe; the Plauen Canal, connecting the Elbe with the Havel; the Eider Canal, connecting the Eider with Kiel; the Rhine-Rhône, and the Rhine-Marne, in Alsace-Lorraine; the great Baltic Sea or Kaiser Wilhelm Canal, begun in 1887 and opened for traffic in 1895, saving two days' time by steamer between Hamburg and all the Baltic ports of Germany; and several canals in process of construction.

The lakes of Germany are chiefly in two groups, of which the smaller is in the southern section, in the Alpine Foreland. These lakes are found only in regions once covered by glacier ice, and their existence is closely connected with the ice sheet that descended from the Alps during the Great Ice Age. The larger group extends over the northern lowland, with the greatest number of lakes east of the Elbe, on the Baltic lake plain, where there are hundreds of them of glacial origin.

CLIMATE. The temperature differences between the north and the south are not so great as might be expected, because the elevation of the south is much higher than that of the north, and counteracts the effect of the difference in latitude. The differences are greater between the west and the east. The Rhine lands are the warmest and the Baltic Sea lands the coldest parts of Germany. The business of the Baltic ports is much impeded by ice in winter, while the North Sea ports are less affected by this impediment, though not quite free from it. A line drawn from Bremen to Munich divides Germany into two sections climatologically. On the west the climate is much like that of France, and mild winters and not excessively hot summers are the rule; but on the east the temperature assumes rapidly a more continental character, tempered by the close proximity to the sea at the north, but rigorous in the interior. The rainfall, owing to the nearness of the sea, is usually sufficient for all forms of agriculture. The Harz Mountains, far enough north to catch

the wet winds from the North Sea, have the heaviest rainfall. The annual rainfall is from 25 to 30 inches for most of Northern Germany, but in the extreme south and west it exceeds 30 inches. In the neighborhood of some of the mountain ranges there are local increases of precipitation to 40 inches and upward.

FLORA. In early days Germany was full of swamps and largely covered with forests. Most of the swamps have now been turned into fields and pastures; but a fourth of the Empire is still covered with forests which are cared for as assiduously as any field crop. A third of the forests are in leaf trees, the beech being most prominent. Two-thirds are in coniferous trees, particularly pines and firs. As the temperature decreases from west to east, the leaf trees predominate in the west excepting in the sandy low plain, and the conifers in the east. The crowning glory of the German flora is these wood lands.

Germany has in the north the Baltic flora and in the south the Alpine. The two mingle in the interior. The elevation of the land also has a strong influence on the local flora; so that the Alpine flora extends far to the north on the mountain tops, and the Baltic flora penetrates to the south in the valleys. Moreover, on the east the steppe flora penetrates from Russia, and on the west the West European flora penetrates from France. Upward of 2200 flowering plants, 60 cryptogams, and 750 mosses are found in German territory. In the south and west the vine grows luxuriantly and grasses flourish in the lowlands.

The best farming lands are in the warm, well-sheltered Rhine Valley, with its rich alluvial soil, where the vine is brought to an unusual degree of perfection. Many of the hill slopes throughout the highland are terraced and cultivated, but the mountains are forest-clad, and cultivation is chiefly confined to the plains and valleys. The soils differ in natural fertility, but are better than those of the low plain of the north, and all deficiencies in plain food are artificially supplied. The soil of most of the low plain is poor and sandy, particularly in the centre and east, and is kept in a state of high productivity only by scientific tillage and fertilization.

FAUNA. Germany, by its northerly situation, exposed to cold airs of the north and cut off from the south by lofty mountains, has a decidedly northern fauna, and the fastnesses of the Harz and the mountains of Bavaria, Saxony, and Silesia have preserved several wild forms extinct or nearly so elsewhere in Europe. Thus there may still be found there bears, wolves (occasionally, along the Russian border), foxes, martens, weasels, badgers, otters, and rarely a wildcat. Fallow deer are known only in a few parks, but the roe and wild boar are obtainable in many forests, and the elk still exists along the Polish border. All these, together with the Alpine chamois, are 'preserved.' The birds are those of Europe, with the absence of several semi-tropical species common south of the Alps. Most of them are migratory, and traverse the Empire along two great 'highways.' One leads to and from Africa along the Rhine-Rhône Valley, and thence east in spring and west in winter along the Baltic shore to and from Northern Russia; the other follows the Danube Valley to and from Asia Minor and India. Of the resident birds the

most remarkable is the great capercaillie of the eastern districts. Reptiles are not as well represented in Germany as in warmer and more diversified France and Italy; and the adder is nowhere common. One of its frogs, called the 'fire-bellied,' is well known. Germany shares in the fish and fisheries of the North Sea, and possesses the larger part of the south shore of the Baltic. This inland sea seems some thousands of years ago to have admitted the ocean more freely, and then, as is shown by prehistoric shell-heaps, marine fishes, oysters, and edible mollusks generally abounded in its waters. Now there are no sea fisheries of consequence in any part of the Baltic, which seems to be growing steadily shallower and fresher, with consequent alteration of its biological character. The rivers of Germany abound in fishes of large variety, among which the salmon and trout that ascend the larger streams from the Baltic are prominent. The carp family is largely represented; and the catfishes (*Siluridae*) of Germany are especially big, numerous, and edible. Insects are numerous, and bees are raised in some provinces to an extent hardly equaled elsewhere in Europe.

GEOLOGY. The surface geological formations of the northern plain are mainly Quaternary sands and clays of alluvial glacial deposit, with an occasional patch of firm Tertiary formation emerging from it. The great central highland is represented by all the formations, but is chiefly Mesozoic. On the southern border of the Quaternary plain where the highlands begin, there are in the region of the Weser highland narrow transition bands of the Cretaceous and Jura formations, which are replaced a little farther south by the great central area of Triassic rocks. On the west of the Weser highland the Quaternary formation of the north is replaced on the south by a broader Cretaceous zone, somewhat interrupted by the Quaternary, and south of the Lippe in the region of the Ruhr is a narrow belt of Dyassic and coal formation which in the Sauerland highlands is replaced by the extensive Devonian and Silurian areas of the middle Rhine, and which extends far to the westward into France. These formations are interrupted by patches of eruptive rocks and Tertiary formations, and are bordered on the south directly on the Rhine by Tertiary formations, which, however, are soon replaced by the Quaternary, which characterizes the upper middle Rhine Valley, and which interrupts the great Triassic area of Central and Southern Germany. West of the Rhine the Quaternary formations of the northern plain extend much farther south than east of the Rhine, and with progress southward are replaced, after slight interruptions, by Tertiary and Triassic formations, by the extensive Devonian and Silurian areas, which are separated from the extensive Triassic area of the south by the Dyassic and coal formations in the Oldenburg region. In the region of the Black Forest on the east and of the Vosges Mountains on the west of the Rhine Valley are extensive areas of old crystalline rocks. In the Harz Mountains the central area of Devonian and Silurian formations is surrounded by a narrow strip of Dyassic formation which on the south is replaced by the Triassic, until interrupted by the Thuringian Forest by recurring Dyassic, Devonian, and Silurian formations. The great central Triassic area is bordered on the south by the long Jurassic chain consisting

of the Swiss, Swabian, and Franconian Juras, which extend on the north side of the Rhône, the Aar, and the Danube from the Rhône to the Main. Parallel to this chain and south of the Aar and the Danube is the extended Tertiary area of the Alpine Foreland and the Chalk Alps, which is separated from the central Alpine region of old crystalline rocks by a narrow border of Jurassic formation. Germany has been glacier-covered as far south as latitude $51\frac{1}{2}^{\circ}$ in the western and $50\frac{1}{2}^{\circ}$ in the eastern part.

X MINING. The mining interests are of great importance, giving employment to over 570,000 persons annually. Germany is the third largest coal and iron producing country in the world, standing next to the United States and Great Britain. The export coal trade is steadily increasing. The total yield of the mines, exclusive of lignite, for 1900, was 109,000,000 tons, valued at \$230,000,000. Of this amount, 93 per cent. was produced in the Prussian provinces of Westphalia, Silesia, and the Rhine. About 5 per cent. came from Saxony and the remainder from Bavaria and Alsace-Lorraine. More than 16,000,000 tons, or about 15 per cent., were produced in Government mines. The steadily growing demand for fuel has greatly increased the mining of brown coal (lignite), in spite of its inferior quality, especially since the device of making it up into briquettes has enhanced its heating qualities and rendered it more convenient for storing and transportation than before. Of the total output of 40,000,000 tons of brown coal in 1900, 34,000,000 tons were produced in the Prussian provinces of Brandenburg, Saxony, and Hesse-Nassau. The following table shows the growth of the coal industry during the last three decades of the nineteenth century:

YEAR	Anthracite and Bituminous	Lignite
1871.....	29,400,000	8,500,000
1881.....	48,700,000	12,800,000
1891.....	73,718,700	20,536,600
1895.....	79,169,300	24,768,400
1900.....	109,225,000	40,279,300

The total production in the year 1900 was nearly 150,000,000 tons, as compared with 242,000,000 for the United States. The annual output of iron has been steadily growing (as the figures below will show), owing to the constantly increasing demand for raw material from the iron and steel works of Germany. The output of iron ore in 1900 was 12,793,065 tons, 4,268,069, or about one-third, of which was obtained in Prussia, and 7,742,315, or over 60 per cent., in Alsace-Lorraine. The output of iron ore in 1891 was 7,555,461 tons; in 1895, 8,436,523. Germany is rich in other ores, such as copper, zinc, lead, bismuth, nickel, cobalt, etc., the bulk of which is produced in Prussia. The quantity of gold is very small, but the silver-mines are perhaps the richest in Europe, yielding 6,243,326 troy ounces in 1900. There are large deposits of rock and other salt and an abundance of potash salts, which have contributed greatly to the development of the chemical industry in Germany. Small quantities of petroleum are found. For a more detailed description, see *Geology and Mining* under special divisions.

FISHERIES. The German fisheries are not of very great importance so far as the number of

people engaged in them is concerned. Among the fishes of Germany the most generally distributed are carp, salmon, trout, and eels. The rivers contain crayfish, pearl-bearing mussels, and leeches. Cod and herring are taken in the North Sea, and the Baltic fisheries have some value. The exports of fresh fish are insignificant. About \$18,000,000 worth of fresh fish, salted herrings, and other preserved and dried fish are imported annually.

AGRICULTURE. Germany is no longer the essentially agricultural country that it was in the middle of the nineteenth century. At that time fully 65 per cent. of the people were engaged in agriculture. In 1882 that industry supported 42 per cent. of the total population of the Empire, and but 35 per cent. in 1895. The one-third of the population engaged in agriculture is no longer able to supply the home demand, Germany having become a heavy importer of food products and raw material. Of the total area of 208,830 square miles, 86,662,721 acres, or 64.8 per cent., were devoted in 1900 to agriculture proper; 34,582,912, or 25.9 per cent., were under forests; the remaining 9.3 per cent. of the land was either unproductive or under dwellings, in streets, or used for other non-agricultural purposes. The two-thirds of the country devoted to agriculture were divided among the various branches of that industry as follows: 48.6 per cent. was under tillage, 16 per cent. under meadows and pastures, and 0.2 per cent. under vineyards.

The land is cultivated with great care and intelligence, both in the rich and fertile river valleys of the south and west as well as on the less favored plains of the north and east, and produces every variety of grain and fruit common to a moderate climate. Wheat, rye, barley, and oats are raised in all sections of the country; corn is raised exclusively in the south; while potatoes, as well as peas and beans, thrive best in the north. Flax and hemp succeed best in the middle regions; and this is also true of the oleaginous seeds, rape, poppy, and caraway. Hops, with the exception of those produced in the Prussian Province of Posen, are raised mainly in the south, in Bavaria, Württemberg, and Baden; and beet-root is grown in Prussian Saxony, Silesia, and Hanover, as well as in Brunswick and Anhalt. (For further details, see the articles on those countries.) The cultivation of cereals and potatoes is the most important branch of agriculture. Among the cereals rye predominates, holding the place in Germany that wheat does in the United States. In 1900, 14,714,738 acres were devoted to the culture of rye, as compared with 10,187,483 acres under oats, 7,953,588 acres under potatoes, 5,063,474 acres under wheat, and 4,126,652 acres under barley.

CROPS	Tons Yield 1880	Tons Yield 1895-99	Area under crops (acres), 1895-99
Rye.....	4,952,000	8,427,000	14,657,972
Wheat.....	2,059,000	3,502,000	4,779,186
Barley.....	2,076,000	2,780,000	4,069,731
Oats.....	3,700,000	6,314,000	9,886,471
Potatoes	19,400,000	35,820,000	7,600,796
Hay.....	29,142,000	23,482,000	14,588,668

Thus, while a great part of the agricultural population was diverted to manufacturing and commercial pursuits, the output of cereals was increased during the last twenty years of the century by from fifty to over one hundred per cent. Still, Germany is obliged to import increasing quantities of grain, especially wheat and corn, for its own use. Germany produces large quantities of beets, hops, and tobacco, the production of sugar-beets having made greater progress there than in any other country, the activity of the Government in granting bonuses and otherwise encouraging the industry being accountable for this growth. From 547,631 acres in 1882, the area under that crop increased to 737,742 acres in 1890, and to 1,078,752 acres in 1900, as compared with 837,669 acres in Austria-Hungary, and 630,105 in France, the next largest beet producers in the world. The principal beet-growing district extends westward from Poland to the region about Brunswick. The production of hops and tobacco is, on the other hand, on the decline. In 1891 the area under hops was 107,835 acres; in 1895 it was only 103,965 acres, and in 1900 it decreased to 91,899 acres. Similarly, the area under tobacco diminished from 59,944 acres in 1880 to 49,702 in 1890, and to 36,114 in 1900. The tobacco crop declined from 52,197 tons in 1880 to 42,372 tons in 1890, and to 30,075 tons in 1900, being valued in the last-mentioned year at about \$6,000,000. It is raised principally in the region of the Rhine and in Brandenburg. The vine is grown along the Rhine and Moselle, in the valleys of the Main and the Saale, in Lower Silesia and Swabia. The Rhine wines have a world-wide fame. Germany imports, however, double the quantity of wines that it exports.

The great increase in the productivity of German agriculture is due to improvements in methods of cultivation and the increasing use of machinery. Census investigations show that in 1882 836 farms employed steam plows; in 1895 there were 1696 such farms; similarly, the number of farms employing mowing-machines increased from 19,634 in 1882 to 35,084 in 1895; those using steam threshers increased from 75,690 to 259,364. Of the farms above 12.5 acres in area the majority used machinery. The farms were distributed as follows:

THE DISTRIBUTION OF AGRICULTURAL LAND IN GERMANY

CLASSES	Number of farms		Area under farms (acres)		Per cent. of the total
	1882	1895	1882	1895	1895
Under 5 acres.....	3,061,831	3,236,367	5,335,774	5,969,724	5.58
From 5 to 12.5 acres.....	981,407	1,016,318	9,471,101	10,263,068	9.57
From 12.5 to 50 acres.....	926,606	998,804	28,396,774	30,980,568	28.96
From 50 to 250 acres.....	281,510	281,767	30,678,609	32,511,444	30.40
250 acres or more.....	24,991	25,061	25,399,263	27,269,815	25.49

The progress of agriculture and the relative importance of the various products are shown in the following table:

The two census investigations of 1882 and 1895 have thrown much light on economic changes in the Empire during the last two decades of the

nineteenth century. In 1882 there were 5,276,344 farms and estates (including garden plots), with a total area of 99,281,521 acres, of which 78,748,230 acres were under actual cultivation. In 1895 the number of farms had increased to 5,558,317, their total area to about 106,970,000 acres, and the area under cultivation to 80,351,832 acres.

The first interesting fact brought out by the

stein, Hanover, and West Prussia; the Prussian studs have a high reputation throughout Europe. Cattle are raised chiefly in the rich marsh lands along the North Sea, and in the fertile valleys and mountain slopes of Bavaria, Württemberg, and Alsace-Lorraine. The following table shows the growth of the stock-breeding industry in the last two decades of the nineteenth century:

YEAR	Horses	Horned cattle	Sheep	Swine	Goats
1882.....	3,114,420	15,454,372	21,116,957	12,174,288	2,452,527
1895.....	3,367,298	17,063,642	12,592,870	13,562,642	3,195,251
1900.....	4,184,099	9,001,106	9,672,143	16,758,436	3,206,726

above table is the enormous proportion of extremely small farms—less than five acres each—which constitute more than 58 per cent. of the total; almost one-third of these are less than one-half of an acre each. At the other extreme are the farms and estates with an area of more than 250 acres each, which constitute less than one-half of one per cent. of the total. The farms with an area of less than five acres each, though constituting much more than one-half of the total number, cover but little more than one-twentieth of the total area. The large landowners possess about one-fourth of all the agricultural lands, leaving about three-fourths of the total area in the hands of the three classes whose farms range from five to 250 acres. As a considerable number of the owners of the fourth class are peasants, it may be said that about one-half of the agricultural land of the Empire is in their hands, the land parcels of less than five acres being owned by workmen or people of small means, who use them as garden plots. The large estates are the property of nobles and capitalists.

More than 86 per cent. of the entire agricultural land is cultivated by the owners, and less than 14 per cent. by tenants. About 41 per cent. of all the farmers cultivate their own land exclusively; a little over 31 per cent. cultivate rented land, in addition to their own; the remaining 28 per cent. cultivate rented land exclusively; the proportion of tenants has remained about the same since 1882.

The number of independent agricultural producers increased in the thirteen-year period between the two censuses about 12 per cent., from 2,283,033 in 1882 to 2,568,725 in 1895. The number of male agricultural laborers in 1895 was 3,239,640. The use of small farms as an auxiliary source of income is increasing. In 1882 3,119,825 persons, including their families, reported agriculture as a subsidiary occupation; in 1895 their number was 3,648,247, or an increase of 17 per cent.

STOCK-BREEDING. The rich meadows on the marshy plains of the north, the grassy mountain slopes and valleys of the central regions and the south, all afford excellent means for the rearing of domestic animals, making the stock-breeding industry important. The scientific cultivation of all kinds of fodder grasses has also contributed greatly to the improvement and increase of German live stock. Sheep-raising has been on the decline for several decades, owing to low prices of wool caused by Australian and Argentine competition, but is still important in Saxony, Silesia, and Brandenburg. The best breeds of horses are raised in Mecklenburg, Hol-

FORESTRY. More than 25 per cent. of the total area of Germany, viz. about 35,000,000 acres, is under forests, the preservation and cultivation of which receives almost as much attention as agriculture, and is scientifically conducted. The local supply of timber, however, does not meet the demands of the home market, and importations are necessary. The larger woods and forests in many of the States belong to the Government, and are under the care of special boards of management, which exercise the right of supervision and control over all forest land, whether public or private. More than a third of all the forests belongs to the various State Governments; about one-sixth is in the hands of the communes; 2.3 per cent. belongs to associations; a less amount to different endowments; and the remainder (about 46 per cent.) to private individuals. The States of Hesse, Baden, Bavaria, Saxony, Württemberg, and Prussia are especially rich in forests. See section on *Flora*.

MANUFACTURES. The industrial progress of Germany has been so marked in the last quarter of a century as to make that country second only in all Europe to Great Britain as a manufacturing State. In 1895 more than 20,000,000 people, or 39.1 per cent. of the entire population, as compared with 16,000,000, or 35.5 per cent., in 1882, depended directly on manufactures and mining for a livelihood. About 8,000,000 persons, as against 6,000,000 in 1882, were engaged directly in industrial establishments. The census specifies 271 distinct industries, classed in 15 large groups, whose importance according to the numbers of establishments and employees is as shown in the table on the next page.

Thus there was an increase from 1882 to 1895 of nearly 35 per cent. in the number of persons employed, while the increase in population was less than 15 per cent. during the same period. According to the number of persons engaged the most important industry is clothing, the next in order of importance being the building trades and the manufacture of foods, with over a million workers each; if we put the third (metal industry) and fourth (machine and instrument making) together, the combined metal industry ranks second only to the clothing industry; next to these and at the same time the most important feeder of the German export trade is the textile industry, which forms the oldest and most important of the German industrial arts. The chief localities for the cultivation and preparation of flax and the weaving of linen fabrics are the mountain valleys of Silesia, Lusatia, Westphalia, the Harz, and Saxony (for thread laces); while cotton fabrics are made principally

in Rhenish Prussia and Saxony. The same districts, together with Pomerania and Bavaria, manufacture the choicest woolen fabrics, including damasks and carpets. Since the formation of the Empire, the textile industries have made remarkable progress, and the German manufactures now practically hold the home market, and

Stettin, Hamburg, Bremen, and other seaports furnish a supply of merchant and navy vessels which occupy the highest place among the mercantile navies of the world for speed, durability, and model equipment. Germany is the largest beet-sugar producing country in the world, its share of the world's produce exceeding 35 per

INDUSTRY	Number of establishments, 1895	Number of persons engaged, 1895	Increase percent. in number of persons since 1882
1. Mining and smelting.....	4,164	540,388	24.7
2. Quarries and potteries.....	48,229	558,286	59.9
3. Metal industry.....	158,457	635,656	39.1
4. Machine and instrument making.....	87,879	582,672	63.6
5. Chemical industry.....	10,385	115,231	60.5
6. Manufacture of lighting material, soap and fats.....	6,191	57,909	35.6
7. Textile industry.....	205,292	993,257	9.1
8. Paper industry.....	17,631	152,909	52.7
9. Leather industry.....	47,325	160,343	31.9
10. Woodworking.....	219,914	598,496	27.4
11. Manufacture of food products.....	269,971	1,021,490	37.3
12. Clothing industry.....	848,845	1,390,604	10.4
13. Building trades.....	198,985	1,045,516	96.0
14. Printing and publishing trades.....	14,193	127,867	82.7
15. Artistic trades.....	9,511	19,879	29.2

export to South America, Australia, the East, and even to England. The growth of the cotton industry can be judged best from the increase of imports of raw cotton, which amounted to about 10,000 tons in 1840, 71,000 tons in 1871, and exceeded 313,000 tons (about 1,250,000 bales) in 1900. The silk industry and the manufacture of velvet thrive especially in Krefeld, Barmen, and Elberfeld, besides Berlin, Baden, and Aix-la-Chapelle. Great progress has been made both in the quality and the quantity of the output, although in the higher grades France still remains unexcelled.

The iron and steel manufactures of Germany are among the most important in the world. The chief seats of this industry are Westphalia and Alsace-Lorraine, the Pennsylvania of Germany; next in importance are the district of Aix-la-Chapelle, and isolated districts in Saxony, Württemberg, Bavaria, and Hanover. Iron and steel furnaces, steel-mills for the manufacture of billets, rails, bars, plates, wire, and other kinds of structural and railroad material turn out their products in enormous and constantly increasing quantities, not only for the domestic markets, but also for distant countries, in competition with Great Britain and the United States. The number of workmen thus employed increased from 164,000 in 1880 to 330,000 in 1900, or more than 100 per cent., producing 2,571,000 tons in the former year and nearly four times as much in the latter. While Germany turns out nearly all kinds of iron and steel products, it is, on the whole, behind the United States and Great Britain, both in quantity and cheapness of its products. In certain branches, however, of the iron industry, Germany excels the rest of the world. In the hardware industry, the words 'Made in Germany' branded on an article are universally accepted as a guaranty of excellence. This applies chiefly to knives, scissors, needles, weapons, and instruments of all kinds. German scientific instruments set the standard for precision and workmanship. The famous Krupp works, employing more than 40,000 workers, are the largest establishment in the world engaged in the manufacture of armor-plates, heavy artillery pieces and projectiles, boilers, engines, and all kinds of half-finished products required in their manufacturing. The shipyards of Danzig, Kiel,

cent. The principal seats of this industry are in Prussia, Brunswick, and Anhalt. The number of sugar manufactories increased from 311 in 1871 to 399 in 1900, while the output increased from 263,000 tons in 1871, when it was but little over one-half of that of France, to 1,790,000 tons in 1900, more than double the output of that country for the same year. The brewing industry is another in which Germany stands unrivaled. The best beer is made in Bavaria; numerous breweries, however, are to be found all over the Empire. Although the number of breweries has been on the decrease, 11,564 in 1880, 8969 in 1890, and 7083 in 1899, the production increased more than 100 per cent. during the same period, being 556,500,000 gallons in 1880, 848,000,000 in 1890, and 1,139,500,000 in 1900. The distilling of alcohol is also increasing, the output having risen from 78,678,500 gallons in 1880 to 97,202,000 in 1900.

In silver, gold, and jewelry work Augsburg and Nuremberg dispute with Munich and Berlin for preëminence, the manufacture of scientific and musical instruments being also important in these cities; while Berlin and Leipzig are among the leading cities of Europe in respect to type-foundries, printing, and lithography. In the manufacture of rubber and gutta-percha goods, glass and pottery ware, clocks, and carved wooden specialties, Germany occupies a leading position. The chemical industry excels that of all other countries, and the same may be said of dyeing and bleaching works. Just as the technical progress made by German industries in the last three decades of the nineteenth century can be compared only with that of the United States, so do the economic aspects of the industrial developments of Germany resemble most closely those of the United States. The chief feature in common is the growing concentration of industry. In no other country save the United States are the number and power of large industrial organizations so great. While the census does not take notice of these forms of industrial and financial organizations, it brings out other facts which illustrate the tendency toward concentration. For instance, it divides the manufacturing establishments of the country into three principal classes (besides a larger number of sub-

classes), viz. small establishments employing five persons or less; those of medium size employing from six to 50 persons; and, finally, large establishments with 50 or more employees. The following table (which includes mercantile as well as industrial establishments) illustrates the growth of each:

CLASS	Number of establishments		Number of persons employed		Increase per cent. in	
	1882	1895	1882	1895	Number of establishments	Number of persons employed
Small estab.....	2,882,768	2,934,723	4,335,822	4,770,669	1.8	10.
Medium-size estab.....	112,715	191,299	1,391,720	2,454,257	69.7	76.3
Large estab.....	9,974	18,965	1,613,247	3,044,343	90.0	88.7
Total.....	3,005,457	3,144,977	7,340,789	10,269,269	4.6	39.9

The figures show that both in the number of establishments and in number of people employed the progress was in proportion to the size of the establishments. Thus, while the total number of establishments increased less than 5 per cent., the higher group increased as much as 90 per cent., the middle group nearly 70 per cent., the lowest barely holding its own. The same tendency is observed in the number of persons employed in each group. With all that, the figures show the preponderance of small industries, the largest number of people being employed in the lowest group. Moreover, considerably more than one-half (nearly 60 per cent.) of those establishments employed no help. But while the number of persons engaged in that group constituted an absolute majority in 1882, it was only about 45 per cent. in 1895. On the other hand, the highest group, which employed between one-fourth and one-fifth of the total number of industrial workers in 1882, absorbed nearly one-third of the total number in 1895. The number of women and minors employed constituted 18.4 per cent. and 6.1 per cent. respectively of the total number of persons employed in 1895. The increased use of machinery is shown by the following figures: In 1882 only 4.7 per cent. of all the industrial establishments employed motive power outside of human labor; in 1895 the percentage rose to 5.9. The prevalence of the small house industry is shown by the fact that in the textile industry not more than 5 per cent. of all the establishments employed motive power, although that figure represented an increase of 100 per cent. as compared with 1882.

RAILWAYS. Germany has the largest railway system in Europe, the total length in 1900 exceeding 30,447 miles, as against 21,748 in the United Kingdom and 26,222 in France, its railway density being second to that of the United Kingdom. The railroad industry is among the most important in Germany, employing half a million persons and representing a capital investment of over \$3,000,000,000. The first railway built in Germany was the Ludwigsbahn, connecting the cities of Nuremberg and Fürth in Bavaria (a distance of about four miles), and opened for traffic in December, 1835. Trains began running on the Leipzig-Dresden line in 1837, and Prussia built the Berlin-Potsdam line in 1838. By 1846 only the minor States had no lines. The railways at that time were, how-

ever, distributed over the country in closely knit groups, each centring around some large city; only in the north were the lines connected. During the next thirty years railway construction was pushed with great energy, with a view to covering the old trade routes and important highways. The following table shows the growth of

railways from the year of their inception until the end of the century:

YEAR	Total length of railways	State lines. Length in miles	Private lines operated by the State	Private lines privately operated	Per cent. of State lines to total
1835	4	0	0	4	0
1840	341	29	0	312	8.5
1850	3,753	1,299	311	2,143	34.6
1860	7,241	3,247	849	43,145	44.9
1870	12,230	5,339	1,661	95,029	43.7
1880	20,627	1,040	2,634	7,591	50.4
1890	25,450	22,719	65	2,667	89.3
1895	27,428	25,013	65	2,350	91.2
1900	30,454	28,052			92.1

The table shows the growth of the railway system as a whole, and of the Government lines in particular. It will be seen that railway construction, which was pushed with great vigor until 1880, went on with a slackened pace after that year, for the great trunk lines of the country had been laid and railway-builders turned to extending the existing systems by means of branch lines to outlying territory. The other interesting fact brought out by the table is the increasing activity of the State in German railway industry. The German Empire as such does not own, however, any railways outside of the Imperial Province of Alsace-Lorraine, the rest of the State lines being owned separately by the various States. (For more detailed information on this point, see the articles on the separate countries, especially Prussia.) Attempts to put the Imperial Government in possession of the entire railway system have not been lacking, but thus far they have all failed because of the separatist sentiment, especially in the smaller southern States. The last attempt made by Bismarck in 1874, in the shape of a bill introduced in the Imperial Parliament, failed. After that the Prussians took the initiative by passing a bill in the Prussian Legislature offering to turn over their entire railway system to the Imperial Government. As the acceptance of the offer would have necessarily required a similar procedure on the part of the other German States, no action was taken. At present each of the twenty-six German States has a railway system of its own, largely owned and operated by the respective governments, a small portion remaining in private hands. Prussia is the most important railway owner; besides the Kingdom of Prussia only seven other States own more than 1000 kilometers (621 miles), their respective lengths in the closing year of the century being as follows:

Prussia, 17,990 miles; Bavaria, 4013 miles; Saxony, 1497 miles; Baden, 1081 miles; Alsace-Lorraine, 989 miles; Württemberg, 979 miles; Hesse, 705 miles; Mecklenburg-Schwerin, 700 miles. Thus Prussia controls the railway situation by holding three-fifths of the entire system, and the eight largest States of the country have more than 93 per cent. of all the railway lines.

SHIPPING AND NAVIGATION. The shipping interests of Germany are second only to those of Great Britain and the United States. In the opening year of the twentieth century the strength of the respective merchant marines of the three countries was as follows: United Kingdom, 9,395,207 tons; United States, 5,524,218 tons; Germany, 1,941,645 tons. The shipping facilities of Germany in 1901 were represented by 1390 steamers of 1,347,875 tons net tonnage, and 2493 sailing vessels, with an aggregate capacity of 573,770 tons. In 1891 there were only 941 steamers of 764,711 tons, and 2698 sailing vessels of 704,274 tons capacity, making a total of 1,468,985 tons. Thus, while the total tonnage increased about 30 per cent., that of the steamers increased more than 76 per cent., while the tonnage of the sailing vessels declined by about one-sixth of its former strength. The number of vessels entering and clearing German ports exceeded 89,000 with more than 18,000,000 tons in 1899, as compared with 10,000,000 tons in 1889, or an increase of about 80 per cent. In 1899 more than 10,000,000 tons, or over 55 per cent. of the total shipping, were carried in German bottoms, while ten years before only about 32 per cent. of the total shipping was in German hands.

The principal countries participating in the shipping of the German Empire are: Great Britain, with about 56 per cent. of the total foreign shipping of the country; Sweden, with about 12½ per cent.; Denmark, with over 11 per cent.; Norway, over 9 per cent.; the Netherlands, less than 4 per cent.; and Russia, with 3 per cent. The principal ports in the order of their importance are Hamburg, Bremen, Stettin, Danzig, Lübeck, Kiel, and Königsberg, the first of these ranking close to London and New York in the amount of its shipping. The merchant marine of the Empire employed nearly 45,000 persons in 1900—a small increase over the 40,400 persons in 1891, and 39,600 in 1881.

COMMERCE. The foreign commerce of the German Empire is subject to the regulations of the federal authorities, all of the States of the Empire together with Luxemburg joining in the so-called Zollverein or Customs Union. Absolute free trade exists between the members of the Union and a uniform tariff is applied to all goods coming to any of the States from foreign countries. In fact, the commercial regulations governing the Customs Union are exactly like those applying to the commercial relations of the individual States of the United States, and of each of those to the Federal Government, with the single exception that in the United States all customs duties collected enter the Federal Treasury to be used solely by the Federal Government, while in the German Empire the surplus over a certain sum is distributed among the members of the Customs Union in proportion to their population.

Germany is second only to Great Britain in

the volume of foreign trade. In 1901 the combined imports and exports of each of the three principal commercial countries of the world were: Great Britain, \$4,353,000,000; Germany, \$2,553,000,000; the United States, \$2,284,000,000. Unlike the United States, Germany imports more goods than it exports. In considering statistics of German commerce it is necessary to distinguish between 'general commerce,' which includes all imports and exports entering or leaving Germany, and 'special commerce,' which includes only imports from foreign countries for consumption in Germany and exports of German products. The geographical position of Germany in the middle of Europe favors a large transit trade, which swells the difference between 'general' and 'special' commerce to considerably more than a quarter of a billion dollars a year. The following table shows the growth of special commerce since the formation of the Empire:

YEAR	Imports	Exports
1872	\$824,670,000	\$593,096,000
1880	676,872,000	706,288,000
1890	1,016,974,000	811,580,000
1895	1,010,548,000	814,912,000
1897	1,157,870,000	901,068,000
1899	1,876,592,000	1,039,584,000
1900	1,438,234,000	1,131,214,000
1901	1,420,146,000	1,132,642,000

Thus the imports constitute about 56 per cent. of the total commerce and the exports 44 per cent. Owing to the enormous industrial progress in the last few decades, Germany has become an importer of foodstuffs and raw material, and an exporter of manufactured products. More than one-fourth of the total imports consist of foodstuffs and other articles of consumption; raw and manufactured textile materials, nearly two-thirds of which is raw, constitute another fourth; manufacturing metals, one-third; and metal ore, less than 8 per cent.; the remainder is made up of fuel, fertilizers, and crude chemicals, fats and oils, lumber, leather, machinery, and live animals. The principal articles of export are textiles, 20 per cent. of the total; half finished and finished metals, manufactured food products, chemicals, machines, tools, and apparatus, coal and leather goods.

The history of the commercial relations of the German Empire with other countries may be divided into three periods: (1) that of free trade, (2) the tariff period, and (3) the treaty period. During the first period, which lasted from the foundation of the Empire to 1879, there was a strong tendency to free trade, and duties so far as levied affected only a small number of articles, and that very slightly, being raised mainly for revenue purposes. In 1879 a new customs tariff went into effect as the result of prolonged agitation on the part of the joint agricultural and industrial forces, who were clamoring for the protection of home industries. That tariff has undergone numerous changes since the year of its promulgation, but the most important change—the one which marks the third period, since 1891—is that it has come to serve merely as an abstract basis for German foreign commercial relations, the real controlling factor being the tariff treaty or convention with respective foreign countries. The general tariff is called autonomous to distinguish it from the

special or treaty tariff. According to existing methods every country which has a commercial treaty with Germany—and this is the case of nearly all countries of importance—enjoys the privilege of a much lower tariff than the autonomous one, in consideration of reciprocal concessions made to German goods; but those countries which make any discrimination against German goods may be subjected to an additional tariff, which may amount to as much as 100 per cent. of the autonomous tariff on all products enumerated therein and a 20 per cent. ad valorem duty on all goods on the free list. With such a weapon in hand Germany has had little difficulty in making commercial treaties with all other nations. The growing divergence of interests between the manufacturers and the landowners has, however, made the renewal of the treaties from 1904 an extremely difficult undertaking to German statesmen. See GERMANY in the article POLITICAL PARTIES. The chief countries participating in German trade are:

three times as great in the last half of the decade 1891 to 1900 as in the first half, reaching the maximum value of \$18,776,736 in 1900. Lard, copper, and oil are the next largest items of export, the first two having increased enormously from 1890 to 1900. The phenomenal increase also in the importation of American meats and fruits has served to add fuel to the fire of German agrarian agitation against the encroachments of the United States. Grouping American exports into five large classes, the increase in the last seven years of the nineteenth century is shown as follows:

	1893	1899
1. Food products.....	\$43,000,000	\$101,000,000
2. Raw materials (cotton, timber, metals, etc.).....	39,000,000	80,000,000
3. Petroleum, lubricating oils.	12,000,000	18,000,000
4. Vegetable and animal oils..	2,000,000	6,000,000
5. Iron and iron products.....		7,000,000

(In considering the above table it should be remembered that the American trade for 1893 was below normal.)

COUNTRY	Per cent. of total imports into Germany from		COUNTRY	Per cent. of total exports from Germany to	
	1900	1890		1900	1890
1. United States.....	16.9	9.5	1. Great Britain.....	19.2	20.7
2. Great Britain.....	13.9	15.0	2. Austria-Hungary.....	10.7	10.3
3. Russia.....	12.1	12.7	3. United States.....	9.3	12.2
4. Austria-Hungary.....	12.0	14.	4. Netherlands.....	8.3	7.6
5. France.....	5.6	6.2	5. Russia.....	7.6	6.1
6. Argentina.....	3.9	1.8	6. Switzerland.....	6.2	5.3
7. British India.....	3.7	3.0	7. France.....	5.9	6.8
8. Belgium.....	3.6	7.4	8. Belgium.....	5.3	4.4
9. Netherlands.....	3.6	7.3	9. Sweden.....	2.9	2.7
10. Italy.....	3.1	8.3	10. Italy.....	2.7	2.8
11. Switzerland.....	2.8	4.1	11. Denmark.....	2.6	2.2

One of the most significant facts brought out by the above table is the preëminence of the United States in the import trade of Germany. In 1880 the United States occupied the seventh place among the countries exporting into Germany; in 1890 it moved up to the fourth, overtaking France, Belgium, and the Netherlands; in 1900 it assumed the first place, outstripping Great Britain, Austria-Hungary, and Russia. In the export trade of Germany, however, the United States occupies only third place, whereas in 1890 it occupied the second. In our own commerce Germany stands next to Great Britain, occupying the second place both in imports and exports, sending 11.4 per cent. of all our imports and taking 13.4 per cent. of our exports. But while the imports from Germany to the United States remained practically stationary throughout the closing decade of the nineteenth century, our exports to Germany increased more than 100 per cent. during that period, as the following table shows:

	Imports into Germany from the United States	Exports from Germany to the United States
1891.....	\$92,795,000	\$97,316,000
1893.....	83,579,000	96,210,000
1895.....	92,054,000	81,014,000
1897.....	125,246,000	111,211,000
1899.....	155,772,000	84,226,000
1900.....	187,348,000	97,375,000

Cotton constitutes the most important of the American exports to Germany, the annual value fluctuating greatly, with a rising tendency, the value in 1900, \$63,576,825, exceeding that of any earlier year. The annual export of corn was

The stationary state of German exports to the United States is seen from the following table of the ten principal articles sent to this country:

	1893	1899
Textiles.....	\$26,703,600	\$20,206,200
Leather and leather goods.....	4,974,200	5,569,200
Paper and paper goods.....	2,142,000	1,523,200
Books and other printed matter.....	4,641,000	3,379,600
Chemicals.....	5,331,200	9,781,800
Cement and porcelain.....	2,142,000	5,045,600
Toys.....	1,594,600	2,475,200
Machinery and other iron products	2,180,600	1,594,600
Glassware and instruments.....	1,761,200	904,400
Ornamental goods.....	856,800	1,689,800
Total of the above.....	\$52,336,200	\$52,169,600

For an account of the colonial commerce of Germany, see COLONIES, in this article.

BANKING. At the head of the German banking system is the Imperial Bank (the Reichsbank). Founded in 1875 by an act of the German Reichstag, it has been ever since the leading bank of issue, and, in addition to other banking operations, has served as the depository of the Imperial Treasury. The bank is under a stricter Government control than even the Bank of England or the Banque de France. Although practically a private stock company, its management is vested in a board of directors appointed by the Government and subject to the orders of the Chancellor of the Empire. The stockholders are represented by a general assembly, electing in turn a central committee, which makes monthly examinations of the affairs of the bank, and whose consent or advice is asked

in certain matters by the board of directors. The bank keeps on deposit all moneys intrusted to it by the Imperial Treasury, and attends to all collections and disbursements on its account without any compensation. Nor are the financial advantages derived by the Government from the operations of the bank limited to that alone. The profits of the bank are distributed as follows: First, an annual dividend of $4\frac{1}{2}$ per cent. on the capital stock of 120,000,000 marks (nearly \$29,000,000) is distributed among the stockholders; second, 20 per cent. of the remaining surplus is added to the reserve fund, so long as the latter does not exceed one-fourth of the capital stock; third, the remaining surplus is divided equally between the shareholders and the Imperial Government, but the half of the surplus is allowed the stockholders only so long as it does not raise their dividends from the above sources to more than 8 per cent. Beyond that, the surplus is divided in the proportion of one-fourth to the stockholders and three-fourths to the Government. Under that arrangement, the stockholders received a dividend of nearly 11 per cent. in 1900.

Unlike the Bank of England or the Banque de France, the Imperial Bank of Germany is not the sole bank of issue in the country. At the time of the enactment of the new bank regulations for the Empire, in 1875, thirty-one other banks were authorized to issue bank notes, the total uncovered note circulation having then been fixed at \$91,630,000, of which \$59,500,000 were allotted to the Imperial Bank, and the remainder apportioned among the rest according to their capital stock. Since then the number of these banks has gradually diminished, the allotment of the bank-note issue of all such being transferred to the Imperial Bank. In the closing year of the century only the following eight banks still retained the right of issue:

	Capital stock	Authorized note issue
Imperial Bank	\$28,560,000	\$69,829,200
Bank of Frankfurt	4,284,000	2,380,000
Bavarian Bank of Issue	1,785,000	7,616,000
Saxon Bank	7,140,000	3,991,498
Württemberg Bank of Issue	2,142,000	2,380,000
Bank of Baden	2,142,000	2,380,000
South German Bank	3,729,936	2,380,000
Bank of Brunswick	2,499,000	673,302
Total	\$52,281,936	\$91,630,000

These banks may issue notes also in excess of the allotments indicated above, but all such amounts are subject to a tax of 5 per cent. The growth of the business of the Imperial Bank from the time of its foundation may be seen from the following figures: The total amount of all kinds of transactions had increased from \$8,734,600,000 in 1876 to \$18,207,000,000 in 1886, to \$31,297,000,000 in 1896, and exceeded \$44,982,000,000 in 1900, while its loans on securities increased from \$111,146,000 in 1876 to more than \$209,440,000 in 1900.

An important business carried on by the Imperial Bank is that in connection with its clearing-house department. The latter was founded in 1883, and the volume of clearings is behind only those of the London and New York houses, exceeding \$4,760,000,000 per annum at the close of the century. Since its organization

several other clearing houses have been established in other cities of Germany, the more important being in Frankfurt, Stuttgart, Cologne, Leipzig, Dresden, Hamburg, and Bremen. In addition to the banks of issue and the branch banks mentioned above, there are about 150 other banks organized as stock companies, whose total capital stock in 1900 exceeded \$428,400,000, as compared with \$302,736,000 in 1885. That does not include the still more numerous private banks, some of which, like the Rothschilds or Bleichröder, are among the foremost banking institutions of the world. There are also several mortgage banks (*Hypothekenbanken*—*crédit foncier*) to minister to the wants of the agricultural population, people's banks (*Volksbanken*) or coöperative loan associations which lend small amounts to needy artisans and owners of workshops, and finally the Prussian Maritime Association, for a description of which, as well as of the most important Berlin banks, the reader is referred to the paragraph on Banking, under PRUSSIA.

GOVERNMENT. In 1815 the Congress of Vienna, which met to reorganize Europe after the Napoleonic wars, formed the thirty-nine component States of Germany (kingdoms, duchies, free cities, and principalities) into a confederation or *Bund*, leaving to each its complete autonomy except in a few matters of common concern. Its only organ of government was a Diet (*Bundestag*), composed of ambassadors from the several members of the Confederation, who voted according to instructions given by their governments. Almost the only powers of the Diet were to declare foreign war and make peace, organize the Federal force made up of the various contingents, and settle interstate disputes. To Austria belonged the presidency of the Confederation, in which she had a predominating influence. As time passed the feeble government of the Confederation fell more and more into disrepute. In 1848 the Liberals throughout Germany united in a revolutionary movement to overthrow the Confederation, and establish in its stead a closer and more efficient union of the German States; and although they failed in this particular, their uprising led to the establishment of constitutional government generally throughout Germany between 1848 and 1851. The war of 1866 between Prussia and Austria was followed by the dissolution of the Confederation. Prussia drew about her the States of North Germany, and formed the North German Confederation, the connection of Austria with the Germanic body being severed, while the States south of the Main concluded offensive and defensive alliances with the new Confederation. The war with France in 1870-71 consummated the union of all the German States into an empire.

The Constitution of the Empire bears the date of April 16, 1871. It is a written instrument, and enumerates with considerable detail the powers and relations of the different organs of government. It may be amended by the Imperial Legislature, according to the usual processes of legislation, except that fourteen negative votes in the Federal Council will defeat an amendment, and that those provisions which guarantee specific rights to individual States are unamendable. The empire which this, the new Constitution, created, consists of four kingdoms, six grand duchies, five duchies, seven principalities, three free cities,

and one territory, all under the presidency of the King of Prussia, who bears the title of German Emperor (art. ii.). It is not, however, a union of equals, for some of the States refused to join except upon their own terms. It thus happens that certain members enjoy specific privileges which do not belong to others. Of these, Prussia is the most highly favored. She has the hereditary right to the presidency of the Union; her representation in the Federal Council is large enough to prevent changes in the Constitution without her consent; she has the casting vote in case of a tie in the Federal Council, and the chairmanship of all the standing committees except one in that body. Among the States upon whom special privileges were bestowed as inducement to enter the Union are Bavaria, Württemberg, and Baden. They are all exempt from Imperial excises on domestic liquors and beer, while Bavaria and Württemberg have their own postal and telegraph systems, and, with certain restrictions, their own military systems. Bavaria, moreover, is exempt from the operation of the Imperial laws for the regulation of railroads except for purposes of military defense, and from the Imperial law of residence and settlement. Bavaria, Württemberg, and Saxony are entitled to seats in the standing committees of the Federal Council on Foreign Affairs and on Army and Fortifications, the chairmanship of the first mentioned committee belonging to Bavaria. The Constitution contains a guarantee that no State so privileged shall be deprived of its rights without its consent (art. lxxviii.). The German Imperial Government may be described as a federal representative system, containing democratic and elective elements on the one hand, and monarchic and hereditary elements on the other. Its federal feature is shown in the constitutional division of the powers of government between the Central Government and the State Governments, and the marking out of a sphere of activity for each. The elective and democratic elements appear in the structure of the Reichstag or National Diet, while the presidency of the Empire furnishes the monarchic and hereditary features. In regard to the methods of governing, the Imperial rule is not parliamentary in the sense of parliamentary government in England, as there is no provision for a responsible Ministry.

For the purposes of legislation the Constitution provides for a National Parliament, the Reichstag, representing the nation as a whole, and the Federal Council, or Bundesrat, representing the individual States. The latter is, to a certain extent, modeled after the old Diet of the Confederation. It is composed of delegates chosen by the governments of the several States that compose the Empire. They are without definite tenure, and are apportioned without much regard to population, but according to the artificial plan of the old Confederation. The Constitution fixes the number of votes in the Federal Council at fifty-eight, of which Prussia has seventeen, Bavaria six, Saxony and Württemberg four each, Baden and Hesse three each, Brunswick and Mecklenburg-Schwerin two each, and the other States one each. The members have the character of ambassadors, and are entitled to the same privileges that are accorded the diplomatic representatives of foreign States. They vote according to instructions from their governments,

and uninstructed votes are not counted. In case a State has more than one vote, the delegation from the State must vote as a unit, but the entire vote to which the State is entitled may be cast by a portion of its representatives. It is left to each State to prescribe the qualifications of its representatives in the Federal Council. The Imperial Constitution and the statutes, however, prescribe a number of disqualifications, most of which relate to the holding of other incompatible offices at the same time.

The Reichstag consists of representatives chosen for a term of five years by direct universal suffrage and secret ballot. By universal suffrage is meant the suffrage of all male citizens who have attained the age of twenty-five years. Those who are in active military or naval service, those who are subject to guardianship, or who are bankrupt or insolvent, or in receipt of poor relief, or condemned to the loss of civil or political rights are disqualified from the exercise of the suffrage. There are at present 397 members of the Diet, and they are distributed among the States on the basis of one representative to every 131,600 of the population. Of these Prussia has 236, or about three-fifths of the whole number. They are chosen by single district ticket, receive no pay, and are uninstructed. No qualifications are provided by the Constitution for membership in the Diet, but by statute the qualifications are fixed at citizenship for a year previous to the election, male sex, and completion of the twenty-fifth year. The constitutional privileges of members consist in exemption from arrest except by consent of the Diet unless the member be taken in the act, exemption from legal responsibility for words spoken in the Diet, and immunity from insult. In addition to these, members of the Federal Council enjoy the privilege of extritoriality, and have the right to champion the measures of their governments in the Reichstag. The power of calling, opening, adjourning, and proroguing both the Diet and the Federal Council and of dissolving the Diet (with the consent of the Federal Council) is a prerogative of the Emperor. He must, however, call them annually, and in case of a dissolution of the Diet he is bound to order the elections within sixty days, and call the new Diet together within ninety days. The Diet, moreover, cannot be adjourned without its consent more than once during the same session or for a longer period than thirty days. The Constitution fixes the quorum of the Diet at a majority, while the presence of the Imperial Chancellor in the Federal Council seems to be sufficient to enable it to proceed with business. The Diet is the judge of the elections and qualifications of its members, and has power over its own internal organization and procedure, except that its sessions must be public. There are constitutional limitations, however, on the power of the Federal Council in this respect; for the president is designated by the Constitution, and the membership of some of its important standing committees is determined by the same authority. So far as the initiation of legislative measures is concerned, the two representative bodies are theoretically on an equality. In the Federal Council each government represented may introduce measures, and it is made the constitutional duty of the president to submit them to deliberation. In the Diet the

initiation of measures is regulated by a rule of the House.

Unlike the French Parliament, the powers of the German Imperial Legislature are enumerated in the Constitution. They include the ratification of treaties, the regulation of foreign and interstate commerce, with certain exceptions in the case of Bavaria and Württemberg; the regulation of the monetary system; the regulation of the criminal law, private law and judicial organization and procedure throughout the Empire; the regulation of citizenship, medical and veterinary practice; the regulation of the customs and the excise upon tobacco, salt, spirituous liquors, beer, sugar, etc.; the regulation of the military and naval systems; the enactment of measures for the execution of the laws; and the settlement of constitutional conflicts within a State in certain contingencies. It will be seen from the enumeration that the power of the German Legislature extends to many subjects which in other States having the federal system of government are left to the regulation of the individual States. As a general thing the power of the Imperial Legislature over these subjects is not exclusive, but they may be regulated by the States in the absence of Imperial legislation. Moreover, in the domain of interstate and foreign relations, the individual States may conclude treaties among themselves for the regulation of their postal and telegraph communication, and even with foreign countries for the regulation of matters of local concern, and to that end may send and receive ambassadors.

The Imperial executive power is vested in the King of Prussia, who is president of the Union, and who bears the title of German Emperor (art. ii.). The succession is regulated by the Prussian Constitution, which makes the crown hereditary in the male branch of the royal house by right of primogeniture and agnatic lineal succession. During the minority of the King the regency is held by the nearest agnate; or, if there be no such agnate, then the Diet shall choose a regent. The King attains his majority at eighteen, and is irresponsible and inviolable. As Emperor he is vested with the power of appointing and receiving ambassadors, other public ministers, and consuls; of negotiating treaties; of waging defensive war, and with the consent of the Federal Council, offensive war; of commanding the army and navy; of promulgating the laws and supervising their execution. His powers in legislation have already been enumerated in another connection. In promulgating the laws he seems to have the power to determine whether they have been constitutionally enacted, and to refuse promulgation if in his opinion they have not; but otherwise he has no veto on Imperial legislation. In supervising the execution of the Imperial laws, which are, for the most part, administered by the State governments at their own expense, he addresses himself, through the Chancellor, to the State executives; and in case of their refusal to carry out the Imperial will, resort is had to federal execution—that is, force is brought to bear upon the recalcitrant State (art. xix.). In the enforcement of the laws, however, for the collection of the Imperial taxes and for the regulation of postal and telegraphic administration, the Emperor does not rely upon the States, but acts through Imperial officials. He appoints all the officials in the Imperial ser-

VOL. VIII.—41.

vice, and may dismiss them. There is an exception, however, in the case of the Imperial judicial officers, who are appointed by the Emperor upon the nomination of the Federal Council, and who cannot be removed by the Emperor. In addition to these powers, which belong to the president of the Federal Union as Emperor, he has a series of important functions as King of Prussia.

The Constitution requires that all the official acts of the Emperor except those which relate to the command of the army shall be countersigned by an officer called the Imperial Chancellor, appointed by the Emperor and removable at his pleasure (art. xvii.). By this act the Chancellor assumes responsibility for the measure, thus insuring the irresponsibility of the Emperor. The Chancellor's responsibility, however, is not to the Legislature, but to the Emperor, for the parliamentary system of government does not exist in the Empire. If, therefore, the Diet refuses to pass his measures or votes a resolution of censure against him, he does not resign, but continues to hold his office, and if he thinks the action of the Diet is not the will of the people he may request the Emperor to dissolve it and order a new election. He is president of the Federal Council, and has a seat in the Diet, where he appears as the chief defender of the policy of the Government and the champion of its measures. He is also the head of the Imperial administration, and supervises in the name of the Emperor the execution of the Imperial laws. To aid him there are at present eleven departments of administration, each under the control of a secretary. They are not his colleagues, but his subordinates; for there is no Imperial Cabinet in the sense in which the term is usually understood. A law of 1878 authorizes the Chancellor to appoint a responsible Vice-Chancellor to aid him when, from pressure of business or other cause, he is unable to discharge his duties. It should also be noted that another important organ of administration is the Federal Council; in fact, the German commentators on the Imperial Constitution treat it as an organ of administration rather than as a chamber of the Legislature. Its most important administrative functions are the formulation of rules for the guidance of the administration, the preparation of the ordinances necessary for the execution of the laws, the issuing of decrees for the coercion of recalcitrant States of the Empire, and a wide participation in the appointment of Imperial officials. Under the last head may be mentioned the nomination of the judges of the Supreme Court of the Empire (*Reichsgericht*) and the election of the members of the Imperial Court of Accounts.

When we turn to the judicial system of the Empire we find few provisions in the Constitution which bear upon the subject—no provision for a Supreme Court or inferior courts, no apportionment of judicial power between the Empire on the one hand and the States on the other, according to the federal system of government, and no guarantees of judicial procedure such as constitute so notable a feature in the Constitution of the United States. The only judicial tribunal in the Empire which has a constitutional basis is the Federal Council, which is designated as a court for the settlement of public-law controversies between States and of constitutional conflicts within States, in both cases when ap-

pealed to by one of the parties. With these exceptions everything relating to the organization, jurisdiction, and procedure of the German courts is left to the regulation of the Legislature, thus making the judicial system a purely statutory creation. It was not until 1877 that the Imperial Legislature passed an act for the organization of the courts (*Gerichtsverfassungsgesetz*). At the same time Imperial codes of civil and criminal procedure were completed and, with the Imperial Judiciary Act for the organization of the courts, went into effect October 1, 1879. An Imperial code of criminal law was completed in 1870, and revised in 1871 and 1876, and more recently (1900) an Imperial civil code was put in force.

The result of all this legislation was the creation for the Empire of a uniform system of courts organized upon Imperial plan, and applying the law, which is not uniform throughout the Empire, according to a uniform system of procedure, an achievement which has done much to bring about the unification of the German States. The Imperial Judiciary Act of 1877 created a system of courts of four grades, the lowest being the district court (*Amtsgerichte*). This is a court of first instance for the trial of petty civil and criminal cases. When hearing civil cases, the court is held by a single judge; in criminal cases the judge associates with himself two laymen called *Schöffen*. At present there are over 1900 such courts in the Empire. Next above the districts courts are the territorial courts (*Landesgerichte*) consisting of from three to five judges, and divided into civil and criminal chambers. They hear appeals from the lower courts, and have a more extensive original jurisdiction in civil and criminal matters. For the trial of important criminal cases jury courts are constituted periodically in connection with the territorial courts. They consist of a bench of three judges and twelve jurors. At present there are over 170 *Landesgerichte* in the Empire. Next in the hierarchy are the superior courts (*Oberlandesgerichte*), likewise divided into civil and criminal senates, the usual number of judges in a criminal senate being seven. They have no original jurisdiction, being exclusively courts of appeal from the territorial courts. At present there are 28 superior courts in the Empire, 15 of which are in Prussia. As a result of a special provision Bavaria alone has an *Oberstes Landesgericht* of 15 judges, which has its seat at Munich. Standing at the top of the judicial hierarchy is the Imperial Court (*Reichsgericht*), which has its seat at Leipzig in Saxony. It is composed of four criminal senates and six civil senates, with an aggregate membership of over 90 judges. The judges are appointed by the Emperor, upon the nomination of the Federal Council. Their tenure is for life, and they are irremovable by any authority except the court itself acting as a disciplinary tribunal. The Imperial Court has no original jurisdiction in civil matters. Its appellate jurisdiction in civil matters extends to cases appealed from the Superior Courts, the Consular Courts, and the Imperial Patent Office Administrative Court. The criminal jurisdiction of the Imperial Court extends in first and last instance to all cases of high treason against the Emperor or the Empire, to appeals in certain cases from the decisions of the territorial courts

and the jury courts, and to appeals from decisions of the Consular Courts.

† The position of the judiciary is one of absolute independence of the administration. The judges can neither be removed, transferred to less desirable judicial stations, nor retired on pension against their will. All the judges (except those of the Imperial Court), about 8000 in number, are appointed and paid by the governments of the States in which they discharge their functions, and they are regarded as State judges, although their positions are created by Imperial law, and their qualifications and duties are prescribed by the same authority.

The Germans, like the French, from whom they have borrowed many legal institutions, have attempted to separate the spheres of justice and administration, and have accordingly intrusted the decisions of administrative controversies, not to the regular judicial courts, as is done in the United States and England, but to special tribunals called administrative courts, composed partly of trained jurists and partly of active administrators. The judges of the German administrative courts, unlike those of France, however, have a position of independence, and cannot be removed at the pleasure of the Emperor, by whom they are appointed. The most important Imperial administrative courts are the poor-law board, the railway court, the patent-office court, and the marine office. If conflicts of jurisdiction occur between the administrative and judicial courts, the proper forum is determined by the Imperial Court, there being no provision for a tribunal of conflicts as in France.

Finally, it should be said that there is little or no Imperial local government in Germany, since the Imperial laws are, for the most part, administered by the State Governments under the supervision of the Emperor. The chief local administrative activity of the Empire, therefore, consists of such supervisory service as may be necessary to insure the strict enforcement of the Imperial laws by the State authorities. For local government in Germany, see PRUSSIA.

FINANCES. The finances of the Empire resemble, in a general way, those of the United States in that they embrace comparatively few items of revenue and expenditure. The Imperial Government cannot levy any taxes except customs and excise duties. The bulk of its revenues is, therefore, derived from these two sources. Excise duties are levied on tobacco, beer, liquors, salt, and sugar. The post and telegraph, both of which are owned and operated by the Government, the railways of Alsace-Lorraine, and stamp-taxes bring in some additional revenue, which is, however, insufficient to cover the expenditures of the Empire. The deficit is covered by contributions from the several States called 'Matricular Beiträge,' and levied on each State in proportion to its population. Prussia is assessed more than 60 per cent. of the entire Federal contribution.

The chief items of expenditure are those for the army and navy, which together absorb more than a third of the entire expenditure. The Imperial treasury spends another third of the budget, and for the service of the debt of the Empire stands the next largest item, exceeding \$20,944,000 per annum, or more than 4½ per cent. of the budget. The growth of the budget of

the Empire from its foundation is shown in the following table:

YEAR	Budget	State contributions
1872.....	\$83,530,860	\$23,002,224
1882.....	141,217,776	24,582,782
1892.....	266,303,198	77,762,692
1900.....	520,362,010	116,609,062
1902.....	559,238,596	136,882,054

The total funded debt of the Empire amounted to \$547,043,000 in the closing year of the nineteenth century. Of this, \$295,120,000 bears $3\frac{1}{2}$ per cent. interest, and the remaining portion 3 per cent. The first loan raised by the Imperial Government was for more than \$3,808,000 in 1877. The growth of the debt since then has been as follows: 1880, \$51,897,804; 1890, \$266,079,716; 1900, \$547,043,000. In addition to the funded debt, there is an interest-bearing debt of \$28,560,000 in the form of treasury bills of denominations smaller than 100 marks.

NATIONAL DEFENSE. All able-bodied men are liable to military service between the ages of seventeen and forty-five years. Three years' active service is required of cavalymen and artillerymen and two years of others, the enlistment generally being at the age of twenty. Students passing a State examination may have the term of active service reduced to one year. The German military force is divided into four armies (Prussia, Bavaria, Saxony, and Württemberg), but there is a uniform plan of organization and administration. In the three States last named each king has a limited power of appointment, and the King of Bavaria of administration. (For particulars concerning the organization of the army, see article on **ARMIES**.) In 1901 the rank and file of the German army, including special officers, amounted to 580,023 men; while the officers numbered 24,145. The greatest war strength of the army is estimated at over 3,000,000 men. Service in the navy instead of the army may be made obligatory upon the maritime population. Numerous additions have been made to the German navy in recent years, giving Germany great strength as a naval power. See **NAVIES**.

Germany is particularly well fortified on the side looking toward France. In this section are situated the strong fortresses of Metz, Strassburg, Ulm, Rastatt, Mainz, Cologne, and Coblenz, and the minor fortifications of Diedenhofen, Saarlouis, New Breisach, Germersheim, Ingolstadt, Hamm, and Wesel. The other large German fortresses are in Eastern or Central Prussia, namely Danzig, Königsberg, Posen, Küstrin, Sandau, Magdeburg, and Neisse. The minor fortresses in the interior are Thorn, Dirschau, Glogau, Glatz, and Königstein. On the coast toward the north are the fortifications of Wilhelmshafen, Kiel, Friedrichsort, Cuxhaven, Geesdemünde, Sonderburg, Stralsund, Swinemünde, Pillau, and Memel.

MONEY, WEIGHT, AND MEASURES. Gold is the single standard of value, silver being legal tender only for amounts not exceeding 20 marks (less than five dollars). The coining of money is in the hands of the Imperial Government. The standard unit is the mark, equal to $24\frac{1}{4}$ cents United States gold money. The mark has one hundred pfennigs. The old thaler is equivalent to three marks. The prevailing coins are the gold

5, 10 and 20 mark pieces, called the half-crown, crown, and double crown respectively; the silver 1, 2 and 5 mark pieces; and bronze coins of smaller denominations.

The metric system has been in vogue since 1872.

COLONIES. The colonies and dependencies of the German Empire comprise German East Africa, German Southwest Africa, Kamerun, Togo, part of New Guinea (Kaiser Wilhelm's Land), the Bismarck Archipelago, part of the Solomon Islands, the Caroline Islands, the Ladrões (Marianne Islands), the Marshall Islands, part of the Samoan Islands, and Kiaochau (on the Chinese coast). The total area is estimated at a little over 1,000,000 square miles, and the population at about 12,000,000. The German colonial system is that of a pure absolutism administered through a centralized bureaucracy. Neither the natives nor the white inhabitants of the colonies have any voice in the fiscal or political administration of the territories. The laws for the colonies are framed by the Imperial Parliament, and German citizens residing in the colonies enjoy the same civil rights as in the mother country. The natives are not regarded as German citizens, but are allowed to acquire citizenship by naturalization in accordance with the general laws regulating such procedure. A fundamental law in respect to the administration of colonies was laid down by the Reichstag in 1886, and subsequently amended in 1887 and 1888. The only exception, whereby the native element is recognized in the administration of colonial affairs, is in the case of some of the districts where it was thought advisable to placate the native chiefs by making them the medium of communication between the Imperial Government and the native population.

The decision as to the budget for the colonies is nominally vested in the Emperor, though virtually it is in the hands of the Governor of the colony and his immediate subordinates. The revenue is derived from taxation, sale or lease of public property, fees, and subventions from the home Government. Direct taxes form as yet but a small item in the revenues; but having been recently introduced, they will, no doubt, yield a greater share in the near future. A house tax has recently been established, applicable both to Europeans and natives. The rate of the tax is expressed in money, but the natives are allowed to offer produce or labor as the equivalent of the tax. The determination of the value of labor and natural products is left, however, to the local authorities, thus permitting the exercise of a good deal of arbitrary power by the colonial officers. Moreover, "measures are provided for the enforcement of the tax, and for this purpose forced labor is permitted." Experience has shown that the system is productive of excessive hardships for the natives, and affords opportunity for the display of great cruelty by the local officers. The revenues derived from the various sources in the colonies are far, however, from being sufficient to cover the necessary expenses, and the home Government finds it necessary to grant large subventions from year to year. Thus, the amounts allowed by the Reichstag for the expenses of colonial administration increased from \$2,261,000 in 1896-97 to over \$7,378,000 in 1901. As will be seen from the following table, the Government sub-

vention forms about 58 per cent. of the revenue in Kamerun; 61 per cent. in Togo; 87 per cent. in New Guinea:

	Imperial subvention		Colonial revenue	
	1894-95	1901	1894-95	1901
German East Africa.....	\$802,060	\$1,693,846	\$511,700	\$1,245,216
German Southwest Africa.....	238,000	2,231,964	6,426	521,300
Kamerun.....	521,934	145,418	379,848
Togo.....	210,392	44,268	134,232
New Guinea.....	168,742	23,800
Kiao-chau.....	2,558,500	71,400
Caroline and Ladrone.....	68,068	5,950

COLONIAL COMMERCE. In 1899, out of a total of \$8,364,986 of imports brought into the German colonies, Germany contributed \$3,754,212, or less than 45 per cent., while of the total exports from the colonies, valued at \$3,620,932, Germany took \$1,198,330, or one-third. As the total amount granted in subventions by the Imperial Government was near \$7,872,000, it will be seen to have exceeded the value of the total colonial trade of Germany. If we take into account the fact that the greater part of German imports into the colonies represents supplies sent there by the Government for the use of its troops, officials, and public works, the value of the German colonial trade becomes insignificant. Thus the colonial system does not seem to have proved commercially profitable, but rather a burden.

POPULATION. The population of the German Empire numbered 56,367,178 in December, 1900, distributed among the several States of the Empire as follows:

STATES OF THE EMPIRE	Area square miles	Population 1880	Population 1900	Population per square mile, 1900
Prussia.....	134,622	29,957,367	34,472,509	256.1
Bavaria.....	29,282	5,584,982	6,176,057	210.9
Württemberg.....	7,528	2,036,522	2,169,480	288.2
Baden.....	5,821	1,657,867	1,867,944	320.9
Saxony.....	5,787	3,502,684	4,202,216	726.1
Mecklenburg-Schwerin.....	5,135	578,342	607,770	118.3
Hesse.....	2,965	992,883	1,119,893	377.7
Oldenburg.....	2,479	364,968	399,180	161.0
Brunswick.....	1,424	403,773	464,333	326.0
Saxe-Weimar.....	1,388	326,091	362,873	261.4
Mecklenburg-Strelitz.....	1,131	97,978	102,602	90.7
Saxe-Meiningen.....	953	223,832	250,731	263.0
Anhalt.....	906	271,963	316,085	348.8
Saxe-Coburg-Gotha.....	755	206,513	229,550	304.0
Saxe-Altenburg.....	511	170,864	194,914	381.4
Lippe.....	469	128,405	138,952	296.2
Waldeck.....	432	57,281	57,918	133.9
Schwarzburg-Rudolstadt.....	363	85,863	93,059	256.3
Schwarzburg-Sondershausen.....	333	75,510	80,898	242.3
Reuss Younger Line.....	319	119,811	139,210	436.3
Schaumburg-Lippe.....	131	39,163	43,132	329.3
Reuss Elder Line.....	122	62,754	68,396	559.7
Hamburg.....	158	622,530	768,349	862.9
Lübeck.....	115	76,485	96,775	841.5
Bremen.....	99	180,443	224,882	2,271.5
Alsace-Lorraine.....	5,600	1,603,506	1,719,470	306.7
Total.....	208,830	49,428,470	56,367,178	269.9

Thus there was an increase of 6,938,708 people in the last decade of the century, equal to 14 per cent.; the increase for the United States for the same period having been 20.7 per cent. Germany ranks next to Russia in population among

the countries of Europe. The growth of the population of the German Empire since its formation has been as follows: 1871, 41,058,804;

1880, 45,234,061; 1890, 49,428,470; 1900, 56,367,178.

The number of inhabitants to the square mile in 1900 was 270. The density varies greatly in different sections of the Empire, being lowest in agricultural Mecklenburg-Strelitz, 90.7 per square mile; and highest in industrial Saxony, 743.4 per square mile.

GROWTH OF CITIES. The increase in the density of population is, to a great extent, due to the increase in the number and size of cities. One-half of the people lived in towns of more than 2000 population in 1895. In 1900 there were 33 cities with a population of more than 100,000 each, as compared with 28 such cities in 1890. The German census divides the cities of the Empire into four groups of large, medium, small, and country towns, the respective populations of which are 100,000 and over; 20,000 to 100,000; 5000 to 20,000; and 2000 to 5000 people. The increase in the number of cities in each group and the proportion of the total population contained in each at various times since the foundation of the Empire are as follows:

	Year	Number of towns	Total population
Towns with a population of 2,000 to 5,000.....	1871	1,716	12.4%
	1890	1,997	12.0
	1895	2,068	12.2
Towns with a population of 5,000 to 20,000.....	1871	529	11.9
	1890	733	13.1
	1895	796	13.6
Towns with a population of 20,000 to 100,000.....	1871	75	7.7
	1890	135	9.8
	1895	150	10.4
Towns with a population of more than 100,000.....	1871	8	4.8
	1890	26	12.1
	1895	28	13.6
Urban population.....	1871	2,328	36.1
	1890	2,891	47.0
	1895	3,042	49.9
Rural population.....	1871	63.9
	1890	63.0
	1895	60.1

The figures show a marked decline in the rural population, which constituted nearly two-thirds of the total population in 1871, and was less than one-half at the opening of the twentieth century. The table following shows the fourteen largest German cities, each having a population exceeding 200,000, according to the census of 1900.

SEX AND CONJUGAL CONDITIONS. In Germany, as in most other civilized countries, the number of females exceeds that of males, although more boys are born every year than girls. The fact being explained by the greater mortality and emigration among men. In 1900 there were 27,-

	1900	1880
Berlin.....	1,888,326	1,122,330
Hamburg.....	705,738	410,127
Munich.....	499,959	230,023
Leipzig.....	465,089	149,081
Breslau.....	422,738	273,912
Dresden.....	395,349	220,818
Cologne.....	372,229	144,772
Frankfort.....	288,489	136,819
Nuremberg.....	261,022	99,519
Hanover.....	235,666	122,843
Magdeburg.....	229,663	97,539
Düsseldorf.....	213,767	95,458
Stettin.....	210,680	91,756
Chemnitz.....	206,584	96,123

731,067 men and 28,613,947 women, the excess of women being 882,880, or 103.2 women to 100 men; the proportion of births is 106 boys to 100 girls. These proportions have remained about the same for the last few decades.

The marriage rate has remained fairly stationary since the foundation of the Empire, being 8.2 per 1000 inhabitants in 1871, 7.5 in 1881, 8 in 1895, 8.2 in 1896, 8.4 in 1897, 8.4 in 1898, 8.6 in 1899. Unlike France, Germany has an increasing surplus of births over deaths. While the birth-rate remains practically stationary, the death-rate is steadily declining, as is shown by the following table:

YEAR	Per 1,000 inhabitants		
	Birth-rate	Death-rate	Excess of births over deaths
1870	40.1	29.0	11.1
1880	39.1	27.5	11.6
1890	37.0	25.6	11.4
1895	37.3	23.4	13.9
1899	37.1	22.7	14.4

The non-German inhabitants of the Empire exceeded 4,000,000, including Poles, Czechs, Wends, Lithuanians, French, Danes, Dutch, Frisians, etc. The most numerous are the Poles (about 3,000,000), who are found exclusively in the east and northeast of Prussia (mainly in Posen and Silesia); the Czechs are found in Silesia, about Oppeln and Breslau; the Wends in Silesia, Brandenburg, and Saxony; the Lithuanians in East Prussia; the French in Alsace-Lorraine; the Danes in Schleswig. The Poles are prominent as a hostile element in the Empire. (See GERMAN LANGUAGE.) Although the Jews (570,000) are scattered over every part of Germany, they are most numerous in the Prussian territories. There were less than 500,000 foreigners residing in Germany at the end of the century; nearly half of them were citizens of Austria-Hungary.

EMIGRATION. Germany has always sent out a considerable number of people willing to seek their fortune beyond the seas. During the eighteenth and the early part of the nineteenth century Russia took great pains to attract German emigrants by granting them various privileges, giving them large tracts of land, and advancing pecuniary aid during the first years of settlement. In the nineteenth century the United States served as the chief field for the ambitious German who did not find room for advancement at home. During that century it is estimated that over 6,000,000 people emigrated from Germany. The high-water mark in the tide of emigration was reached in 1881, when nearly 221,000 Germans left the Fatherland; since that year the

number has steadily diminished, as is shown by the following figures:

YEAR	No. of emigrants	Per cent. of total population	No. of emigrants to the U.S.
1881.....	220,902	4.86	
1885.....	110,119	2.36	
1890.....	97,103	1.97	85,112
1891.....	120,089	2.41	108,611
1895.....	37,498	0.72	30,692
1900.....	22,309	0.40	19,338

The fluctuations observable are the result of increasing or decreasing prosperity at home or abroad. Nearly 90 per cent. of all the emigrants go to the United States, less than 5 per cent. to Brazil, Argentina, and other American countries, and the remainder to Australia, Africa, and Asia. There was a great drop in the emigration to the United States in the years 1893 and 1894 as a result of the commercial depression in the United States in those years.

RELIGION. Germany is generally considered a strongly Protestant nation, though the Protestant element numbers somewhat less than two thirds of the total population. The number of Protestants in 1900 was 35,231,000, or about 63 per cent., as against 20,321,000 Catholics, or about 36 per cent. The proportionate distribution of these religious bodies has changed but little since the religious wars of the seventeenth century, and is characterized by a decided grouping within definite limits, corresponding to the States, or to smaller political divisions, so that in most localities one or the other religion is strongly predominant. Some change in the relative proportions of the two sects has been effected in the large cities as a result of the movement of population, accompanying their recent growth. Central Germany is, generally speaking, the stronghold of Protestantism, and the Rhine and Danube regions of Catholicism. More than one-third of the population of Prussia consists of Roman Catholics, who are especially numerous in Posen, Silesia, Westphalia, and the Rhine Province. In Bavaria, Alsace-Lorraine, and Baden the Catholics far outnumber the Protestants. In Saxony, together with the eighteen minor States, there are only 31 Catholics per 1000 of the population, and they but little exceed this proportion throughout the greater part of Central Prussia. In Württemberg and Hesse the Catholics form nearly one-third of the population.

The Protestant Church in Germany contrasts with that of America and England in that it is not split up into numerous rival factions. The adherents of the Church are divided between the two confessions, the Lutheran and the Reformed, and the United Evangelical Church (dating from 1817, and at first established only in Prussia), formed by a union of the Lutheran and Reformed bodies under State auspices. The largest Protestant denomination outside of the Lutheran and Reformed bodies, that of the Baptists, numbers only about 30,000 members. This Evangelical Church is the most numerous body. By its latitudinarianism, the Protestant Church has retained within its fold the followers of many widely different schools of thought, from extreme orthodoxy to rationalism. At the end of the nineteenth century the tendency toward rationalism in theology, which had long been

so prominent in Germany, was apparently on the decline. In the last quarter of the century a considerable element of the laboring class in the large centres of population had become divorced from any Church through the rise of the socialistic propaganda, the defection varying in intensity from passive indifference, growing out of the belief that the Church was in league with the present political order, to a radical opposition to all religion. The Protestant body has suffered much more severely from this movement than has the Catholic, the priesthood of the latter organization having been largely successful in checking the movement through their activity in establishing Catholic organizations for laboring men. The most recent statistics show that the relative numbers of Catholics and Protestants remain very nearly constant, the slight difference in favor of the Protestants being attributable partly to the greater increase of the population in the Protestant provinces, and in part, also, to the fact that there is a greater defection of Catholics to the Protestant Church than vice versa. The seceders from the Catholic Church after the Vatican Council of 1870 assumed the name of Old Catholics, and this faction now numbers about 50,000. The Roman Catholics have concentrated their forces until they have become politically the strongest party in the Empire, and have consequently obtained certain advantageous concessions. The severe Prussian laws of 1873 directed against Ultramontaniam, by attempting especially to limit and to control Catholic education, were repealed in 1887, and religious congregations—the Jesuits excepted—existing for charitable or contemplative purposes, are allowed. The different branches of the Christian faith are subsidized by the individual States, and in some the Jews are also supported.

EDUCATION. From almost the beginning of modern times Germany has held the primacy in educational rank. It has been distinguished both for the general diffusion of knowledge and for the superiority of its specialists in the various fields of learning. Many of the names most prominent in the pedagogical world are German. As early as 1642 Weimar had enacted a compulsory educational law, and before the middle of the century other places in Germany had followed the example. At present every child in the Empire must attend school every school day in the year (usually about 42 weeks) for a period which, in most German States, extends from the ages of six to fourteen years. The law is enforced to the letter, and there are scarcely any evasions. As a consequence illiteracy has been practically eliminated.

The early movement for the improvement and extension of education was the result largely of the efforts of the Church, which had almost exclusive charge of educational matters. The first systematic educational effort dates back to the Carolingian schools attached to monasteries and cathedrals. Their methods prevailed with some modifications through the Middle Ages. By the end of the fifteenth century common schools were widespread in Germany. The ecclesiastical conflicts of the sixteenth century checked for the time educational progress, which was successfully resumed after the cessation of the religious wars. Frederick William I. of Prussia established at his own expense 400

schools for the common people; and his son, Frederick the Great, was very active in furthering educational interests. For the regulation of schools he promulgated in 1763 an order that is considered the basis of the present German system. This order fixed a period for compulsory attendance, supplemented school support from the State funds, and provided for the superintendence of schools and regulations for the selection of teachers. A law of 1794 held that all public schools and educational institutions were under the care of the State, at the same time recognizing religious instruction under the proviso that children trained in one religious faith could not be forced to take instruction in another. The educational system was revised in 1854, and again in 1872. The interest so early manifested has never been relaxed. It was estimated as early as 1840 that the pupils of Prussia numbered one-sixth of the population.

Germany has been free from the bitter religious wrangles that have characterized the educational history of France and of the United Kingdom; for it was agreed almost without question in Germany that there should be religious teaching. Schools are provided for Catholics, Protestants, and Hebrews separately, with teachers of the respective faiths; or, if conditions do not justify the establishment of separate schools, special arrangements are made separately and at the State's expense for instruction on the subject of religion. With the growth of State aid and the centralization of the school system, ecclesiastical authority has been greatly lessened, but a large per cent. of the school inspectors are still the local pastors. Ecclesiastical authorities inspect the religious instruction given in the secondary schools, but their rôle is only advisory.

The educational scheme in Germany is made to conform closely to the existing social order, and is strikingly different in arrangement from the American. The classification resulting from the recognition of religious differences has already been noted; but of still greater moment are the differences due to the distinction made between the sexes, and to the recognition of social classes. There are, therefore, decided differentiations between schools, and a disregard of coördination. There is no clear-cut line of demarcation between primary and secondary education, as in America, and such distinctions as the German recognizes do not correspond with those familiar to Americans. Of the different courses provided in Germany, each leads to a different goal, each confers certain social privileges and rank. The courses which admit to the greatest honors are guarded by their greater cost, and thus are removed beyond the reach of the lower classes.

PRIMARY EDUCATION. The schools usually referred to as primary are known as the *Volkschulen*, which provide for the entire period of compulsory attendance. In recent years tuition charges at these schools have been generally abolished. The course here does not coördinate with the courses in the higher schools which lead to social preferment, and practically none of the pupils who complete it take up the work in the secondary schools. The only further educational provision for these children—except the few selected for normal students—are the *Fortbildungsschulen* or continuation schools (which offer two or three-year courses on evenings and Sundays, and which in some States are compulsory), and

certain other technical classes. A prominent feature in the Fortbildungsschulen are manual training, industrial and trade courses—courses that are wholly omitted in the primary grades. The children who attend the Volksschulen are from the lower masses. Parents who have in view for their children careers which are reached only through the secondary schools generally send them first to schools which prepare for the higher classes, or at least remove them from the Volksschule at the end of the third or fourth year. The Vorschule—a three years' preparatory course to the secondary schools—is sometimes found in connection with those schools. The State supports no kindergarten schools. They are maintained through private agencies, and are sometimes aided by the municipality.

✓ SECONDARY EDUCATION. The secondary system is built up with little regard to the primary system. It takes its form solely with regard to the career for which it is intended to prepare. The secondary course proper begins with the fourth year of the child's school life. The selection made for the child at that time practically determines its life's work, for the different secondary courses are characterized by great rigidity—there is practically no changing from one to another. Only recently, since about 1892, has the attempt been made, on the 'Frankfurt plan,' to introduce a system making transference at certain periods possible. In the secondary school system of earlier centuries the ancient classics held a dominant position, and an extensive system of privileges admitting to social rank had been based upon them, and tended to give them a peculiar persistence. The schools in which the classics still constitute the central feature of the course are called the *Gymnasien*, and it is only by taking this course that admission may be secured to many of the highest Government positions or the highest social recognition reached. But the requirements of a practical age have demanded greater and greater concessions. An entirely different class of schools—the *Realschulen*—have grown up, in which the modern languages are the centre of the course, special attention being given to mathematics and natural sciences, without offering technical training. Schools of this nature began to be popular as early as the time of Frederick the Great, but it was not until the last half of the nineteenth century that the obstacles in their way were sufficiently removed to allow them a rapid growth. There has naturally been a development along a compromised line, as shown in the *Realgymnasien*—Latin being retained and practical subjects substituted for the Greek. And, indeed, since 1900, substitutes for Greek are accepted in the Prussian *Gymnasien*.

Secondary education, therefore, has developed along three lines represented respectively by the *Gymnasien*, *Realschulen*, and *Realgymnasien*. Each of these types embraces two classes of schools, the distinguishing feature being the length of the curriculum—generally either six or nine years. The main factor determining this time-classification is the privilege afforded, to those who have completed six years in the recognized secondary schools, of reducing the period of compulsory military service in the army to one year. The desirability of this reduction, and especially the social prestige which it implies, induce many to complete the six years, after

which they are likely to discontinue the course unless they have in view university or other advanced study, and further special privileges. Accordingly many schools give only the first six years of the course. Those which offer the full nine years are the *Gymnasien*, *Realgymnasien*, and *Oberrealschulen*, while the corresponding schools of six years are the *Progymnasien*, *Realprogymnasien*, and *Realschulen*, the *Höhere Bürgerschulen* belonging also to the latter class. Graduates from the *Oberrealschulen* are admitted to study in most of the special or technical branches given at the universities, and also in the mathematical and natural science courses; while those who have graduated from the *Realgymnasien* may take, in addition to the preceding, certain other branches, such as modern languages. The entire university course, including some of the most desirable branches like theology, law, medicine, and ancient philology and history, is open only to the graduates of the *Gymnasien*, though Prussia since 1900 has thrown open all its faculties, except theology, to graduates of the *Realgymnasien* and the *Oberrealschulen*. The relative importance of the different classes of secondary schools in Germany is seen in a statement of their number. In 1897 there were 439 *Gymnasien* and 92 *Progymnasien*; 128 *Realgymnasien* and 93 *Realprogymnasien*; 198 *Realschulen* and 4 *Oberrealschulen*, besides 2 *Höhere Bürgerschulen*, 32 other public schools, and 56 private schools.

As seen above, the secondary course of instruction is definitely planned with reference to a professional career. Since it is not intended that women should follow these careers, it is not necessary that they take these preparatory courses. Under the prevailing social and military order, the Government demands the most exacting preparation of its men for the service of the State. This consideration, which involves great expense, limits the extent of State support to female secondary education. Most of the secondary schools are limited to a nine years' course (including the *Vorschulen*) and are not recognized as secondary schools, but as *Mittelschulen*. The *Höhere Mädchenschulen*, however, are of secondary rank, although the ancient classics have no place in their curriculum, the modern languages—German, French, and English—taking their place. Very recently three schools offering courses identical with those of the boys' *Gymnasien* have been established for girls.

UNIVERSITIES. Germany has 21* universities, the largest being Berlin, with about 5500 pupils, Munich, 4500, and Leipzig, 3500 (these figures do not include non-matriculated students). The other universities, arranged in order of the number of students matriculated, are as follows: Bonn, Breslau, Freiburg, Halle, Tübingen, Heidelberg, Göttingen, Marburg, Strassburg, Würzburg, Kiel, Königsberg, Erlangen, Giessen, Greifswald, Münster, Jena, Rostock. The universities of Freiburg, Munich, Münster, and Würzburg have Roman Catholic faculties of theology; Bonn, Breslau, and Tübingen have mixed Catholic and Protestant faculties; and the other universities are all Protestant. University students are allowed an extreme degree of liberty, in striking contrast to the rigid discipline observed in the secondary schools. Indeed, the spirit of freedom pervading the university life, as evidenced especially in the great liberty

enjoyed by the university faculties in thought and speech, is an anomaly in a government so strongly military, and making itself so prominently felt in all other phases of life. The universities are of equal rank, and the entrance requirements are the same, namely: The completion of the secondary schools—admission to all university courses being secured only by completing the course at the *Gymnasien*. While the universities are in theory non-respecters of persons or social classes, they are in reality exclusive, because the expense of university life and of the secondary course preceding it tends to limit the attendance to representatives of the higher social classes.

SCHOOL ADMINISTRATION. The German States act independently in their school systems. The main important outlines of the respective systems are nevertheless almost uniform. There is much variation in details. The Prussian system is generally described as representative. The control of the Prussian schools is through the Department of Education, subject to the limitations of the Constitution and of precedent. The head of the department is a Cabinet officer, known as the Minister of Religion, Education, and Medical Affairs. The Minister is aided by a large number of special councilors. There are two divisions in the department, the first having charge mainly of the universities and the secondary schools, the second of other branches of education. In each province there is a school board, of which the president of the province is chairman. The other members are proposed by the Minister of Education and appointed by the King. This board supervises the most general matters, such as questions concerning text-books, etc., and especially matters concerning the secondary schools. The provinces are divided into 'governments,' and these again into districts, both the large and small divisions having school boards. These 'Government' school boards concern themselves more particularly with the common schools. The district board erects buildings, supervises salaries and pensions, and other local financial matters. Its principal member is the inspector, who is appointed for life. Finally there is the local school board—one for each school—exercising oversight over external matters such as repairs, supplies, etc. Local authorities have nothing to do with the internal affairs of the schools, the central authority possessing absolute control.

Germany offers ample provisions for every phase of technical instruction. There are a very large number of artisan and trade schools, also special schools for agriculture, forestry, mining, architecture, art and art-industry, and in addition nine technical high schools and polytechnics, these last two being as high in rank as the polytechnical colleges in America.

TEACHERS. No country is as particular as Germany in the selection and preparation of teachers. The teacher is an officer of the State, and enjoys a prominent social rank. He is sure of his position for life, or, after a period of service, of retirement upon a pension. However, honor is an important part of his compensation, for, especially in the primary schools, the salary is very meagre and occasions much complaint. The qualifications required of teachers are about uniform in the different States, and each recognizes the certificates granted by the others. The

process of selecting candidates for primary teaching begins with the children in the primary schools, only the most promising pupils being selected. On leaving the primary school the child takes a three years' course, especially designed for preparation for the normal school (seminary), where one year more of academic work and three years of normal work are demanded, the student, if needy, being financially assisted by the State. By limiting the number of preparatory schools, the State can prevent the creation of any serious overplus of teachers. The feature of religious devotion is prominent in the seminaries—these being either Protestant or Catholic. After finishing the seminary the candidate receives a provisional appointment and is only permanently accepted after demonstrating fitness and passing a final examination.

SCHOOL FUNDS. The method of the development of the school system has resulted in a complicated and diversified system of financial support. There are generally local taxes, which if necessary are supplemented by the State. The State fund is the largest source, supplying about one-half of the expenses, while local taxation supplies about one-fourth. The Church and Church societies are often important contributors.

CHARITIES. The different German States, except Bavaria and Alsace-Lorraine, have adopted uniform systems of poor laws, but there is no centralized system of administration. Each poor-law district provides for its own poor, a residence of two years being the requisite time to determine the place of settlement, although relief may be given by the local authorities of the district in which the individual has temporary residence, to be recovered from the community in which the settlement of the individual is fixed. The distinction between public and private charity is not closely drawn.

The Empire has played a very important part in providing for the welfare of the masses and thus checking the possibility of destitution, through the establishment of compulsory insurance against accident, sickness, and old age. None of the other leading nations have made provisions of so comprehensive a nature for the benefit of the laboring classes. Insurance against sickness, the first step taken, was first secured in 1883, followed in 1884 by the insurance against accident, and in 1889 against old age. Numerous benefit societies conducting insurance features, already in existence, were recognized by the Government, and allowed to act as agents in lieu of those appointed by the State, which subjected all such organizations to a uniform system and control. The division of administration necessitates an increased expenditure, and an attempt has been made to centralize the entire administration of the system in the hands of the State. In the insurance against sickness, two-thirds of the premium is contributed by the workmen and one-third by the employer. In the insurance against accident, the employer class is responsible for the burden of contribution, but the relief to the injured laboring man is taken from the sick-fund for the first thirteen weeks, and it is only after the expiration of that period that the employer class becomes liable. Insurance against old age is obligatory upon all laborers whose wages do not exceed 2000 marks a year. The premium paid is divided evenly between the laborer and the employer. The re-

ceipt of the pension begins when the one insured reaches the age of seventy. The insurance scheme has stood the test to the satisfaction of both employer and employed. In 1898 the insurance against sickness included over 9,233,000 workmen, while the accident insurance included 18,246,000 persons, and 512,000 received old-age annuities.

HISTORY.

The history of Germany may be said to begin with the year 843, when, by the Treaty of Verdun, the vast Empire of Charles the Great was divided into three parts among his grandsons. (For the earlier periods, see *GERMANIA*; *FRANKS*; *CHARLES THE GREAT*; *CAROLINGIANS*, etc.) In the partition of Verdun, Louis the German (843-76) received the eastern portion of the Frankish Empire, which included the purely Germanic peoples. Until 911 legitimate or illegitimate Carolingians held the throne, but their power was comparatively little, and depended almost wholly on their strength in their own possessions. Instead of a united Germany, there were several great German duchies—Swabia, Bavaria, Franconia, Saxony, and sometimes Lotharingia or Lorraine. The last, however, was debatable territory; independent at first, it later was connected with its stronger neighbor, Germany or France, as the case might be. At first the Franconians and Saxons were the strongest nations, and supplied the rulers of the German Kingdom. Charles the Fat (876-87), son of Louis the German, succeeded for a brief time (about 884-87) in reuniting the old Frankish lands under his sway, but they fell apart again after his death, and Germany was ruled by Arnulf till 899. The last Carolingian King, Louis the Child, died in 911, and the German princes elected as his successor Conrad of Franconia (911-18). His reign was a constant struggle to maintain his position against his own nobles, while at the same time he had to contend against the Hungarian invaders. Just before his death he sent the insignia of royalty to his most dangerous subject, Henry the Saxon (919-36), and the latter was chosen King by the Franks and Saxons. After six years of fighting and negotiations, Henry the Fowler (as he was popularly known) was recognized by the Swabians and Bavarians also. Under him for the first time it is possible to speak of a united Germany. He made his power respected by repulsing the invaders who had been devastating the eastern and northern portions of the German duchies. The Slavs and Danes were defeated, Lorraine was conquered, and finally, in 933, a great victory was won on the Unstrut over the Hungarians. His son Otto I. (936-73) succeeded to a strong kingdom. At the coronation banquet he was served by the dukes of Lorraine, Franconia, Swabia, and Bavaria. Otto restricted the power of the dukes, checked renewed invasions of the Hungarians, defeating them decisively at the Lech in 955, and organized an efficient administrative system. In 951 he was called to Italy to aid one of the contending factions there; in 961, after wresting Northern Italy from Berengar II., a descendant of Charles the Great, he was crowned King of the Lombards, and in 962 he received the Imperial crown at the hands of the Pope, thus becoming the founder of the Holy Roman Empire of the German Nation, which existed till 1806. (See *HOLY*

ROMAN EMPIRE.) By his coronation Italy and Germany became associated for long centuries to come. The results were in some ways disastrous to both countries, but at the time Otto, as Emperor, was the great power in Western Europe. In order to strengthen his position, he negotiated a marriage for his son with the daughter of the Byzantine Emperor. Otto II. (973-83) died at the age of twenty-eight, and left an heir of three, Otto III. (983-1002). In consequence of the extent to which the Imperial power was enlisted in the affairs of Italy at this time, weakness and disunion were bred in Germany. Henry II. (1002-24) left Italy to itself for some years, and devoted his reign to strengthening the power of the King of Germany. He reformed the Church, and employed its officials in the service of the State. He repressed private wars, and won the support of the nobles by giving them greater privileges. He was the last King of the Saxon House.

Conrad the Franconian, or Salic (1024-39), was an able ruler, who added the dominions of the Arletan realm (see *BURGUNDY*) to the Empire. His son and successor, Henry III. (1039-56), extended the boundaries of Germany on the side of Hungary, repressed the insolence and despotism of the temporal and spiritual princes of Germany, and gained the respect of his contemporaries by his zeal for justice and his valor in the field. The minority of his son and successor, Henry IV. (1056-1106), enabled the nobles to recover much of their former power, and to apply a check to the further consolidation of the Imperial authority, which had been considerably extended during the two preceding reigns. Henry's constant quarrels with Pope Gregory VII. entangled him in difficulties and mortifications which ended only with his life, and which plunged Germany into anarchy and disorder. (See *INVESTITURE*.) With his son and successor, Henry V. (1106-25), the male line of the Franconian Dynasty became extinct, and after the crown had been worn (1125-37) by Lothair of Saxony, Conrad III., Duke of Franconia, inaugurated the Hohenstaufen Dynasty. His reign (1138-52), in which the civil wars of the Guelphs and Ghibellines (q.v.) began, was distracted by the dissensions of the great feudatories of the Empire, while the strength of Germany was wasted in the disastrous Second Crusade, in which Conrad took an active part. Frederick I. (1152-90), surnamed Barbarossa, Duke of Swabia, was, at the recommendation of his uncle, Conrad, chosen his successor, and the splendor of his reign fully warranted the selection. By the force of his character Frederick acquired an influence over the diets which had not been possessed by any of his immediate predecessors, and during his reign many important changes were effected in the mutual relations of the great duchies and principalities of Germany, while we now for the first time hear of the hereditary right possessed by certain princes to exercise the privilege of electing the Emperor. (See *ELECTORS*, *GERMAN IMPERIAL*.) Unfortunately for Germany, this great monarch suffered his desire to uphold the Imperial authority in Italy to draw him away from the interests of his own country, while his participation in the Crusades, in which both he and the flower of his chivalry perished, was memorable only for the

misfortunes which it entailed on the Empire. The interval between the death of Frederick Barbarossa (1190) and the accession of Rudolph I. (1273), the first Emperor of the Hapsburg line, was one of constant struggle, internal dissension, and foreign wars. Individually the princes of the Hohenstaufen Dynasty were popular monarchs, distinguished for their many noble and chivalrous qualities, while one of the race, Frederick II., was, after Charles the Great, perhaps the most remarkable sovereign of the Middle Ages; but their ambitious designs on Italy, and their constant but futile struggles with the Papal power, were a source of misery to Germany. The territory in which the Holy Roman Emperors of the time of Hohenstaufen exercised their sway, or their overlordship, reached on the west to the rivers Rhône, Saône, Meuse, and Scheldt (thus embracing a large strip of modern France, Belgium, and the Netherlands), and extended on the east to the borders of Hungary and Poland, including most of what is now Cisleithan Austria, exclusive of Galicia. On the north it extended as far as the Eider, and in the south nominal limits of the Empire reached down into Italy beyond Rome. Henry VI. (1190-97), son of Frederick Barbarossa, attempted to make the Imperial dignity hereditary in his family. After his death Philip of Swabia (1198-1208) and Otho IV. of Brunswick contended for the Imperial throne, the latter being recognized on the assassination of his rival by Otho of Wittelsbach. With Frederick II. (1215-50), the successor of Otho IV., ended the glory of the Empire, till it was partially revived by the House of Hapsburg. Frederick's son, Conrad IV. (1250-54), the last of the Hohenstaufen (q.v.), after a brief and troubled reign, was succeeded by various princes, who in turn, or in some cases contemporaneously (the Great Interregnum, so called), bore the Imperial title without exercising its legitimate functions or authority—William of Holland (1247-56), Alfonso the Wise of Castile (1257-62), Richard of Cornwall (1257-72). This season of anarchy was terminated at the accession of Rudolph I. (1273-91), of the House of Hapsburg, who, by the destruction of the strongholds of the nobles and the stringent enforcement of the laws, restored order. His chief efforts were, however, directed to the aggrandizement of his house. In 1276 he vanquished Ottokar II. of Bohemia, and forced him to give up the duchies of Austria, Styria, Carinthia, etc. Ottokar, having renewed the struggle, was defeated and slain on the Marchfeld in 1278. (See AUSTRIA-HUNGARY.) For the next two hundred years the history of the Holy Roman Empire presents very few features of interest, and may be briefly passed over. Adolphus of Nassau, who was elected to succeed Rudolph (1292), was attacked in 1298 by the son of the latter, Albert I. of Austria, who coveted the Imperial throne, and the war speedily ended in the triumph of Albert. The reign of this prince (1298-1308) is chiefly memorable as the period in which the three Swiss cantons of Unterwalden, Schwyz, and Uri succeeded in making themselves independent of the Austrian power. After the murder of Albert, the throne was occupied in rapid succession by Henry VII. (1308-13), of the House of Luxemburg (whose dynasty ruled for a century in Bohemia), and by the rival Emperors Frederick of Austria (1314-22) and Louis the

Bavarian (1314-47). Charles IV. (1347-78), the successor of Louis, of the House of Luxemburg, was the successful candidate among seven rivals. Although he was engrossed by the interests of his hereditary possessions of Bohemia, Moravia, Silesia, and Lusatia, he did not entirely neglect those of the Empire, for which he provided by a written constitution known as the Golden Bull (q.v.), issued in 1356, which regulated the rights, privileges, and duties of the Imperial electors, and the mode of election and coronation of the emperors. The seven princes designated in the Golden Bull as Imperial Electors were the archbishops of Mainz, Treves, and Cologne, the Duke of Saxony, the Margrave of Brandenburg, the Count Palatine of the Rhine, and the King of Bohemia. Charles's son Wenzel, or Wenceslas (1378-1400), who was finally deposed, brought the royal authority into contempt, from which it was scarcely redeemed by Rupert of the Palatinate (1400-10). The reign of Sigismund (1410-37), the brother of Wenceslas, is noteworthy in connection with the councils of Constance and Basel and the Hussite wars. With Sigismund the Luxemburg line of emperors terminated. In the person of Albert II. of Austria (1438-39), the House of Hapsburg once more secured possession of the Imperial throne, which, with slight interruption, was occupied by them to the end, although the crown remained elective. After a brief reign, in which he gave evidence of capacity for governing, Albert was succeeded by his cousin, Frederick III. (1440-93), an accomplished but avaricious and indolent prince, whose chief object seems to have been the aggrandizement of the House of Austria.

Aspirations toward national unity had appeared before this among the people of Germany, but they ran counter to the spirit of feudal anarchy, and to the family policy of the Hapsburgs, who became by their marriage alliances more and more involved in general European affairs and less interested in those of Germany. The emperors could not be made, therefore, the leaders of a national movement, which sought rather to realize itself, first through the Diet, and then in alliance with the Lutheran Reformation. (See REFORMATION.) Upon this conflict, and upon the religious differences which grew out of the work of Martin Luther and John Calvin, the politics of the Empire turned for 150 years. These tendencies developed fully under Maximilian I. (1493-1519), during whose reign an active agitation was carried on in the Diet for reform (see AULIC COUNCIL; IMPERIAL CHAMBER), while Luther's bold challenge in 1517 set into play giant forces of change which were destined to shape German history for all future. At the same time, the marriages of Maximilian drew the Hapsburgs more than ever into interests outside of Germany. The first of these marriages, with Mary, heiress of Charles the Bold of Burgundy (1477), added to the Hapsburg possessions the great Burgundian territories in the Low Countries; the second, with the daughter of Ludovico il Moro, Duke of Milan (1494), threw the Imperial house into the stormy politics of Italy. The marriage of the son of the Emperor, the Archduke Philip, with Joanna of Spain made that country, then at the summit of its prosperity and power, likewise a Hapsburg possession in the person of Maxi-

milian's grandson, Charles I. of Spain, who was elected Emperor in 1519 as Charles V. (1519-56). The energies of Charles were mainly directed to the prosecution of the war against France. The Austrian possessions of the House of Hapsburg were bestowed on his brother Ferdinand (from whom the present German-Magyar-Slav monarchy of Austria-Hungary may be said to date), the control of affairs in Germany was left largely in the hands of the Imperial chambers, the pressing need for reform received little attention, and the spread of the Reformation was allowed to continue unchecked. Luther, it is true, was placed under the ban of the Empire in 1521; but at Speier, in 1526, the Reformers gained a notable triumph, and it was not until the Diet of Augsburg, in 1530, that the Protestants and the Emperor came to an open breach. Danger from the French King and from the Turks, however, prevented Charles from taking action against the recusant princes, and for some ten years after 1531 the Schmalkaldic League (q.v.) of Protestant princes exercised a preponderating influence in German affairs. Only in 1546 did the Emperor find an opportunity for turning on the Protestants; the power of the Schmalkaldic League was broken in the battle of Mühlberg (1547), and the Protestant leaders, John Frederick, Elector of Saxony, and Philip, Landgrave of Hesse, were made prisoners. Charles was now supreme in Germany, and it seemed for a moment as if he would succeed in winning back the Protestants into the Catholic fold. (See under INTERIM, section on *Augsburg Interim*.) But jealousy of his growing power caused Maurice of Saxony, Albert, Duke of Mecklenburg, the Margrave of Brandenburg, and William, the son of Philip of Hesse, to league against him in alliance with the French King, Henry II., who in 1552 wrested from the Empire the bishoprics of Metz, Toul, and Verdun. The Treaty of Passau (q.v.), concluded in the same year, confirmed by the Peace of Augsburg in 1555, granted to the Lutheran States the right to establish the Protestant worship. Broken by the uniform ill success of his policy, Charles laid down the government of the Netherlands in 1555, and in the following year abdicated the Spanish and Imperial thrones, being succeeded in the Empire by his brother, Ferdinand I. (1556-64). The reigns of Ferdinand and Maximilian II. (1564-76) witnessed the very rapid growth of the Counter-Reformation (q.v.). Profiting by the dissensions prevailing among the Protestants, Roman Catholicism, issuing in renewed vigor from the Council of Trent (1545-63), boldly challenged the progress of the Reformed religion. Rudolph II. (1576-1612) was under the influence of the Jesuits, and lent himself to the aggressive policy of the Catholic party. In 1608 the Evangelical Union was organized under the leadership of the Elector Palatine, and this was followed by the foundation of the Catholic League in the following year. Matthias (1612-19) was less aggressive than his predecessor, but weak, and let himself be guided by the extreme faction of the Catholic party. The election of his cousin Ferdinand, a bitter enemy of the Protestants, to be King of Bohemia, in 1617, was the signal for the outbreak of a struggle that had long been seen to be inevitable. See THIRTY YEARS' WAR. The Thirty Years' War (1618-48), which was terminated in the reign of Ferdinand III. (1637-

57), left the rural districts of Germany almost depopulated, its trade and industries crippled, the people burdened with taxes, and the Imperial power weakened by the concessions made in the Peace of Westphalia to the autonomy of the individual States. Austria came to be regarded by the German nationalists as a foreign power, and the recognition of the Lutherans and Calvinists as factors in the Empire broke down the religious unity on which the mediæval Empire rested. Already, under Henry IV., France had adopted an anti-Hapsburg policy, rightly regarding that house, with its vast possessions, as the chief rival of France in European affairs. Richelieu (q.v.) carried on this policy vigorously during the Thirty Years' War, in assisting the Swedes and the Protestant princes against the Imperialists, and the French arms had a great share in forcing the Catholic powers to terms of peace. When the growth of the power of France in the seventeenth and eighteenth centuries threatened the balance of power in Europe, the Hapsburgs were naturally drawn into the coalition against France. (See LOUIS XIV.; SUCCESSION WARS, section on the *War of the Spanish Succession*.) The Imperialist forces under Prince Eugene of Savoy shared in the victories which put an end to the aggressions of Louis XIV., but the Empire derived no substantial advantage, except in the limitation that was put upon the growth of French predominance. The emperors during this period were Leopold I. (1658-1705), Joseph I. (1705-11), and Charles VI. (1711-40).

The rise of Prussia now becomes one of the most striking features in German affairs. Since the time of the Great Elector, Frederick William (1640-88), the Margraviate of Brandenburg had been acquiring increased importance as a leading power among the Protestant German States. In 1701 the Elector Frederick assumed the title of King of Prussia, and was so recognized. Thus, while still a vassal of the Emperor, he took rank by virtue of his royal title with the other independent sovereigns of Europe. Prussia, by reason of its rapidly increasing power, its Protestantism, and the energy infused into its administration, came to be the exponent of the German national spirit and of the enmity to Hapsburg domination. Frederick the Great (1740-86) was the mighty representative of this idea. The long effort of the Emperor Charles VI. to secure the guaranty of the European States for the Pragmatic Sanction (q.v.), which was intended to secure the unquestioned succession of his daughter Maria Theresa in the Hapsburg dominions, did not prevent an active contest which involved Europe in war (1740-48). (See under SUCCESSION WARS, the section on the *War of the Austrian Succession*.) Austria was stripped of the greater part of Silesia by Frederick the Great. After an interregnum, Charles Albert, Elector of Bavaria, was raised to the Imperial throne as Charles VII. in 1742. He died in 1745 in the midst of his unsuccessful war with Austria, and the husband of Maria Theresa, Francis Stephen, of the House of Lorraine, was elected his successor, assuming the title of Francis I. The peace which followed the War of the Austrian Succession was of brief duration. In 1756 Maria Theresa renewed the struggle with Prussia in order to recover Silesia. The historical hostility between England and France.

and between Austria and Prussia, developed into a general European war, in which, by a sudden change of alliances, Austria and France, with Russia, were ranged against England and Prussia. (See SEVEN YEARS' WAR.) Prussia came out of this bloody struggle with enhanced prestige, a recognized military power of the first rank in Europe. The well-meant but injudiciously applied reforms of the Emperor Joseph II. (1765-90) did not strengthen the incongruous Austrian State, and his attempts to restore the declining Imperial authority in Germany were frustrated by Prussia.

The French Revolution disturbed all previous adjustments. Austria, under the Emperor Leopold II. (1790-92) and his successor the Emperor Francis II., and Prussia, under Frederick William II. (1786-97), were for a time united in resistance to the revolutionary propaganda which threatened the thrones of Europe, but were defeated by the French armies. The advent of Napoleon played havoc with the Germanic system. He succeeded in partially isolating Austria and Prussia, by inducing many of the Western German princes to form the Confederation of the Rhine, and ally themselves with France (1806). Francis II. in 1806 laid down the title of Holy Roman Emperor, having previously assumed that of Emperor of Austria. This abandonment of a title that represented a system with which the whole history of Germany had been bound up was symbolic of the actual breaking up of the old order and the preparation for a new Germany. When Napoleon had been overthrown, it was found, in spite of the policy of conservative reaction, to be neither possible nor desirable to restore the old system. The more than three hundred semi-independent States which had existed in the eighteenth century had been consolidated by Napoleon into thirty-nine—a fact which was of much service in promoting German unity. Prussia, which had been dismembered by Napoleon and trodden under foot, emerged from the War of Liberation rejuvenated by the patriotism of its people and strengthened by thorough-going reforms, and was prepared again to dispute precedence with Austria in the Germanic body. It was manifestly impossible to restore the old Imperial arrangements, which had become worthless long before they were cast aside. The Congress of Vienna (see VIENNA, CONGRESS OF), therefore, in 1815 instituted a Germanic Confederation under the guaranty of the European powers. There was to be a Federal Diet, in which Austria was to have the presidency.

All of the German States were now disturbed by agitations for constitutional government, which were fought inch by inch by many of the princes. The dominant spirit among the rulers was that of reaction, and the control of affairs was largely in the hands of the astute Austrian Chancellor, Prince Metternich (q.v.). Three parties represented the contending ideas of government held in Germany after the Restoration—the absolutists, among whom were found most of the reigning families, including those of Austria and Prussia; the party of historic rights, who had no faith in constitutions, but stood on the traditional customs of the German people, such as the assemblies of estates; and the constitutionalists, liberal and more or less democratic, strongest in South Germany, where the French influ-

ence had been most felt. This liberalism was especially fostered among the students in the universities (see BURSCHIENSCHAFT), and was closely connected with the spirit of nationalism, which was rapidly gaining strength. The chief obstacle to national unity was now, as it had always been, the obstinacy with which the princes clung to their feudal status and to the independence which had grown therefrom. The problem had been made simpler by the Napoleonic consolidations, but the princes who remained were made stronger by the same means. Only the leadership of some State that should be willing to represent the aspirations of the people, and strong enough to coerce resisting States, could accomplish what the nationalists sought. This rôle was reserved for Prussia. The revolutionary agitation of 1830 was felt in Germany, and gave some impulse to the constitutional movement, strengthened by the establishment of the Zollverein (q.v.) or Customs Union, due to the initiative of Prussia; but it was not until the more stirring year of 1848 that the forces of discontent and progress that had been at work in spite of Metternich's repressive policy really showed themselves in their strength. On March 13th Metternich was driven from power. (See AUSTRIA-HUNGARY.) A few days later a successful popular rising took place in Berlin, and at the same time Louis I. of Bavaria was compelled to abdicate. In April there was a republican insurrection in Baden, which, however, was speedily suppressed. In response to the demand for a National Parliament, such a body was assembled at Frankfort (May 18, 1848-May 13, 1849). A provisional national government was organized under an Imperial administrator, the Archduke John of Austria. The Parliament, however, was divided into factions, and a struggle between the Austrian and Prussian parties ensued. Austria sought to bring its whole Empire into the new organization, with a preponderating voice in affairs, which would have made the new Empire non-German. Prussia and the German nationalists objected, and finally carried the day, choosing the King of Prussia to be Emperor of the Germans (1849). Frederick William IV. was not equal to the great opportunity, and he rejected the proffered crown because it came from the people and not from his peers, the German princes. The desertion of the national cause by Prussia was followed by insurrections in the Palatinate, Saxony, and Baden, which were rigorously put down, mainly by the arms of Prussia, and the opportunity for the erection of a German nation went by until it should be recreated by the 'blood and iron' policy of Bismarck (q.v.). The National Parliament having gone to pieces, Austria and Prussia united in 1850 to restore the old Diet. The two powers now proceeded to establish the old order in the duchies of Schleswig and Holstein, which had risen in revolt against Denmark. Prussia assumed the leadership in proposing plans for reorganizing the Germanic body, but could not harmonize its own ambitions with those of Austria. In 1858 Prince William became Regent of Prussia, and in 1861 succeeded his brother as William I. Imbued with the conservative spirit of the Hohenzollerns, but possessed of much sound sense, courage, and patriotism, he met the existing situation in a different spirit from that of his weak predecessor. Bismarck early became

his chief minister, and remained at his side until his death. The latter saw the futility of all efforts at German organization that had been previously made, and determined that the only way to the attainment of the great object was for Prussia to force a direct issue with Austria, and fight it out as the champion of German nationality. The opportunity was found in the troubled affairs of Schleswig-Holstein (q.v.). By the Convention of Gastein (August 14, 1865), Austria and Prussia arranged a joint occupation of the duchies, against the wishes of the smaller States represented in the Diet. In this common administration, although the sphere of each power was defined, there was ample opportunity for the outbreak of the old rivalry. Austria sought to force the hand of Prussia by referring the settlement of the Schleswig-Holstein question to the Federal Diet. Prussia met this move by sending its forces into Holstein, which had been under Austrian occupation. The Diet now ordered the mobilization of the Federal forces (June 14, 1866). Prussia at once began hostilities, having previously formed an alliance with Italy against Austria. (See SEVEN WEEKS' WAR.) Prussia's preparedness was shown by her prompt action in each detail. She ordered Hanover, Hesse-Cassel, and Saxony, which had adhered to Austria, to disarm, and at once invaded their territories. The Saxon army retired through Bohemia, to effect a junction with the Austrians; the Hanoverians laid down their arms after a useless show of resistance; and the Prussians, having secured their base, declared war against Austria, and invaded Bohemia in three columns. The rapid movement, efficiency, and thorough equipment of the Prussian Army surprised Europe as much as did the inefficiency and lack of organization of the Austrians. In the vigorous campaign, whose brief duration has given its popular name to the war, Austria met a succession of defeats, culminating in the overwhelming one of Sadowa, or Königgrätz, July 3d. By the Peace of Prague (August 23, 1866) the dissolution of the old Confederation was consummated. Austria ceased to be a member of the Germanic body, and Schleswig-Holstein, Hanover, Electoral Hesse, Nassau, and Frankfort were incorporated with Prussia, which negotiated separate treaties with Baden, Bavaria, the Grand Duchy of Hesse, Saxony, and Württemberg.

The North German Confederation was now constituted under Prussian leadership. Bavaria, Württemberg, and Baden allied themselves with the new body, though they did not enter it. Their treaties with Prussia provided for an offensive and defensive alliance, and acceptance of Prussian leadership in case of war. The Constituent Diet of the new Confederation met February 24, 1867, and proceeded to frame a constitution, which forms the basis of that of the present Empire. The aspirations of Prussia looked to the completion of German unity and the establishment of the paramount influence of the new German State in European affairs. Bismarck was well aware that the consolidation of Germany meant eventual war with Germany's ancient enemy, and he prepared for it as thoroughly as he had for the conflict with Austria. War was narrowly averted in 1867, when France sought to occupy Luxemburg as a compensation for the territorial acquisitions of Prussia, and in 1869, when France showed unequivocally her desire to annex

Belgium. The intention of Spain to seat a Hohenzollern prince on the vacant throne offered an opportunity for her quarrel which France was now seeking, and the injudicious conduct of Benedetti, the French Minister at Berlin, the fatuous insistence of the French Foreign Minister, Gramont, upon an impossible apology from King William, and the shrewd and unscrupulous use made by Bismarck of the dispatch relating thereto, stirred a feeling in both countries that could only result in war, which was declared by France July 19, 1870. The French, not realizing that the day of Napoleonic conquests had passed, still less that the day of United Germany had come, expected to invade Germany, win over the Southern German States, and to march straight on Berlin. Instead, they found the German Army mobilized on the frontier, and the South German States loyal to their alliance. A quick succession of German victories was followed by the surrender of MacMahon's army and the capture of Napoleon himself at Sedan (September 2, 1870), the investment of Paris, and the capitulation of Bazaine at Metz (October 27th). While the united armies of Germany were still besieging Paris, King William, at Versailles, in the *Galerie des Glaces*, amid a brilliant assemblage of princes and officers, received from the people of Germany, in pursuance of the decree of the North German Diet of December 10, 1870, the title of German Emperor, hereditary in the Prussian Dynasty (January 18, 1871). On the 16th of April the Constitution of the Empire, which was substantially that of the North German Confederation, with the addition of certain special provisions for the South German States, was promulgated. By the treaty of peace with France, signed on the 10th day of May, at Frankfort-on-the-Main, Germany received the provinces of Alsace, with the exception of Belfort, and the German-speaking part of Lorraine, including Metz and Thionville, and an indemnity of five milliards of francs (\$1,000,000,000). See FRANCO-GERMAN WAR.

The southern States had entered the new Empire, and the King of Bavaria, the largest German State outside of Prussia, had acted as spokesman in proffering the crown of United Germany to King William. The military preponderance of France on the Continent of Europe was at an end. Secure in its position as a dominant power, the new Germany was free to develop its national genius. But Bismarck's internal policy during the first years of the Empire was not as successful as his State-building process had been. He became involved in a conflict with the Roman Church, and this became the leading issue in Imperial politics for six years, from 1873 to 1879. (See KULTURKAMPF.) The preponderating position of Germany in the affairs of Europe was asserted at the time of the Russo-Turkish War (1877-78), when the Congress of Berlin was convened for the settlement of the Eastern Question. After the attempts upon the life of the Emperor in 1878, attributed to Socialist fanatics, vigorous legislative measures were taken to suppress Socialism as an organized force, while at the same time the Government undertook legislation for the benefit of the working classes, such as compulsory State insurance. An extensive system of canals was begun in 1886, including the great Kaiser Wilhelm Canal, connecting the North Sea and the Baltic, which was opened June 19,

1895, with imposing ceremonies. As soon as Austria had been expelled from the Germanic body it became Bismarck's policy to cultivate friendly relations with that country, as Germany's closest neighbor and kin, and in 1883 the Triple Alliance (q.v.), comprising Austria, Germany, and Italy, was formed, with the object of maintaining the balance against France and Russia. In 1884 Germany embarked upon her career as a colonizing power. (See GERMAN EAST AFRICA; GERMAN SOUTHWEST AFRICA; KAMERUN.) Emperor William I. died in 1888, and was succeeded by his son, Frederick III., who was then suffering from cancer of the throat, and died in a few months. He was succeeded by his son, William II. The history of Germany since his accession has been characterized by the social and economic movements common to all of the Western nations at the close of the nineteenth and at the opening of the twentieth century, while as a growing world power Germany has become one of the chief factors in the questions arising from the colonial enterprises of the nations of the West and the increasing solidarity of mankind. Differences very early developed between the Kaiser and the great Chancellor, and an issue having been made on the Government's policy toward the Socialists, Bismarck was ordered to resign, and his resignation was accepted March 20, 1890. He was succeeded by General von Caprivi (q.v.). The Emperor himself, after his plan of an international labor conference had failed, became a bitter opponent of the Socialists. After 1879 Germany maintained a protective tariff, and duties were considerably increased in several directions, though the operation of the fixed tariff was much modified by tariffs based upon reciprocity treaties. The steady development of German industry and commerce checked the stream of emigration, and the population has continued to increase at an undiminished rate. Caprivi retired from the Chancellorship in 1894, giving place to Prince Hohenlohe. Of recent years very active interest has been taken in the development of the merchant marine and navy. The Naval Bill of 1898 pointed in its preamble to the increased volume of imports and exports, colonial expansion, increasing population, and the investment of large amounts of capital abroad as indications of the need of a strong navy. The bill (passed March 28, 1898) provided for an expenditure of an amount equivalent to \$102,000,000, of which \$89,000,000 was to be expended on fleets and armament. This was expected to bring the strength of the navy up to 19 battle-ships, 8 coast-defense vessels, 9 large and 26 small cruisers, and numerous smaller craft. A bill passed with some difficulty in June, 1900, practically doubled this programme, extending the period of operation over twenty years, and providing for 33 battle-ships and a corresponding complement of cruisers and smaller vessels. As in all the constitutional countries of Continental Europe, strong party organization is made impossible in Germany by the numerous factions and the lack of a responsible Ministry. (See POLITICAL PARTIES, paragraph on Germany.) Prince Bismarck had been reluctantly forced into a colonial policy by the growth of German commercial interests, and William II. actively promoted this development in various parts of the world. In 1898 he seized the pretext of the murder of two German mis-

sionaries in China to exact from that country the cession of the port of Kiao-chau and 200 square miles of adjacent territory, and to establish a sphere of influence in Shan-tung, one of the richest Chinese provinces. He then attempted, during the outbreak of 1900 and in the events which followed the Boxer movement, to claim for Germany in the Far East the same predominant rôle that Bismarck had sought to win for her in Europe. (See CHINESE EMPIRE.) Prince Hohenlohe resigned the Chancellorship in 1900, partly because of disagreement with the Emperor's Chinese policy, and was succeeded by Count von Bülow. German commercial and industrial activities are now world-wide. The actual territorial possessions of the Empire outside of its own borders are in Africa, in the partition of which Germany has had a large share (see AFRICA), and a few islands in the Pacific; but German settlements, merchants, and factories are found in Mexico, Central and South America, and in Asiatic Turkey, and German banks in many parts of the world are the stable foundation of activity in trade and industry. German colonization and commercial societies, well supported financially and managed with skill and energy, support these enterprises, and are actively fostered by the home Government. Such associations are found operating in Central and South America, in Senegambia, on the Gold Coast, in Australia, Tahiti, and Sumatra, as well as in the countries under the German flag. Parallel with this activity in the world's industrial competition has been a very intelligent policy of subsidizing steamship lines to Oriental and African ports, intended to make Germany independent in its carrying trade. In every way the German Government supports its citizens in spreading German influence, and it has never failed to defend the interest of German merchants where these have been threatened by disorder or revolution in weakly governed countries, as in Haiti at the end of 1902, or in Venezuela (q.v.), in conjunction with Great Britain and Italy, in the early part of 1903.

HISTORY. For brief treatments of German history, consult: Henderson, *A Short History of Germany* (New York, 1901), a product of modern critical scholarship. Bryce, *The Holy Roman Empire* (New York and London, 1892), is a luminous essay that must be studied to understand the political development of Germany and its relations with the Holy Roman Empire. The history of Germany in mediæval times is adequately treated by Henderson, *History of Germany in the Middle Ages* (London and New York, 1894); Lamprecht, *Deutsche Geschichte* (Berlin, 1891-94); Giesebrecht, *Geschichte der deutschen Kaiserzeit* (Brunswick, 1881-90). The following are standard works by some of the foremost of German historians on the modern period: Marcks, *Germany and England: Their Relations in the Great Crises of European History, 1500-1900*, trans. (London, 1900); Sybel, *Die Begründung des deutschen Reichs* (Munich, 1890-94), trans. by Perrin and Bradford as *The Foundation of the German Empire* (New York, 1890-98); Treitschke, *Deutsche Geschichte im neunzehnten Jahrhundert* (Leipzig, 1879-94); Maurenbrecher, *Gründung des deutschen Reichs 1859-71* (Leipzig, 1892); Oncken, *Das Zeitalter der Revolution, des Kaiserreiches und der Befreiungskriege* (Berlin, 1890-92); Bulle, *Geschichte der neuesten Zeit, 1815-71* (Leipzig, 1886-87); Erdmannsdörffer, *Deutsche Geschichte vom westphälischen Frieden bis zum Regierungsantritt Friedrichs des Grossen, 1648-1740* (Berlin, 1892-94). Useful available books in English are: Malletson, *The Refounding of the German Empire, 1848-71* (London, 1893); Müller, *Political History of Recent Times, 1816-75* (New York, 1882), translated and brought down to 1881 by Peters, a compact and useful volume, written with special reference to Germany; Murdock, *The Reconstruction of Europe* (Boston, 1889); Baring-Gould, *Germany, Past and Present* (London, 1881). For an account of German diplomacy during the critical period of its history in the nineteenth century, consult Debidour, *Histoire diplomatique de l'Europe, 1814-78*, vols. i. and ii. (Paris, 1891). For detailed references on German history, consult the bibliographies in Lavis and Rambaud, *Histoire générale* (Paris, 1893-1900); Seignobos, *Political History of Europe Since 1814* (New York, 1900), and especially Dahlmann-Waitz, *Quellenkunde der deutschen Geschichte*, edited by Steindorff (Göttingen, 1894). See, also, authorities referred to under the names of persons, parties, and places noted in the text, as BIS-MARCK-SCHÖNHÄUSEN; CALVIN; FREDERICK II.; THIRTY YEARS' WAR; etc.

GERMAN Y LLORENTE, HÀR-mán' é lyó-rán'tá, BERNARDO (1685-1757). A Spanish painter, born at Seville. He studied under his father and Cristobal Lopez. He painted the portrait of the Infant, Don Philip, with such success that in 1717 he was called to Madrid by Philip V., who desired to make him Court painter, but he declined the honor, preferring an independent life. In 1735 he was made a member of the

Academy of Saint Ferdinand. The works of this artist resemble closely those of Murillo in their grace, correctness of drawing, and groupings, and in other countries they have been sold as original Murillos. He so frequently painted the Virgin as a shepherdess that he was called the 'Painter of Shepherdesses.' One of these paintings is in the Church of San Ildefonso, Madrid, and another in the Prado.

GERM-CELL. See CELL and EMBRYOLOGY.

GERMERSHEIM, gér'mèrs-hím. A fortified town in the Bavarian Palatinate, Germany, situated a short distance from the Rhine, and nine miles southwest of Speyer. It has some manufactures. Population, in 1900, 5868. The Romans had a station here under the name of Vicus Julii. The French were defeated here by the Austrians in 1793.

GERMINAL, zhâr'mé'nâl' (Fr., relating to buds). (1) The name for the seventh month of the year in the French Republican calendar, from March 21st to April 19th during the years I.-III., and from March 22d to April 20th during the years VIII.-XIII. (2) One of the Rougon-Macquart novels by Zola (1885), dealing pessimistically with the question of labor as shown in the mines. Etienne, a type of laborer who has fallen under the influence of socialistic ideas, is contrasted with the rich Grégoire, indifferent to the problems of the workmen. The story introduces strongly drawn characters, and its descriptions of the collier's life and of the scenes of the strike are among Zola's best work.

GERMINAL INSURRECTION. A name given to the bread riots against the Convention at Paris, which occurred on April 1, 1795 (12th Germinal, Year III.).

GERMINATION (Lat. *germinatio*, from *germinare*, to bud, from *germen*, bud). The process by which a spore begins the development of a plant body. Technically, only spores germinate, but this term has been extended to include the process by which the embryo escapes from the seed. The so-called germination of the seed, however, is not true germination, since it is the escape of an embryo which has already been germinated, and true germination includes the very beginnings of the young plant. In the case of a seed, germination begun by a fertilized egg has been checked, and seed-germination is the resumption of activity and the escape of the young plant.

The conditions of germination are uniform. In general, they are suitable amounts of water, of heat, and of oxygen. Naturally the range in each one of these factors is very great, some spores germinating in the presence of a comparatively small amount of water, or at a relatively low temperature, while others need a large amount of water or high temperature. Between these extremes there is every possible combination of requirements. Some spores germinate almost immediately after they have been transported from the parent plant; while others may pass into a resting condition of greater or less duration. This difference in habit is generally apparent in the different character of the spore wall, those spores which are to germinate quickly having thin walls, and those which are to pass into a resting condition having thick walls. Since the spore consists of a single cell, the first

evidence of germination is the activity of the cell, which usually enlarges, and then divides, resulting in a two-celled embryo. One or both of the daughter cells then grow to mature size, and division then occurs. In this process of growth and division, the spore wall is broken, and the young plant emerges, and continues its development by drawing upon the reserve food-supply in the spore until it is able to maintain itself.

GERMINATION.

1 and 2, germination of pollen-grain of pine; 3 and 4, young embryo of buttercup; 5 and 6, first and last stages of embryo of a fern.

The early stages of germination have attracted a great deal of attention, under the impression that they furnish proofs of the relationships of groups. Accordingly, the order of succession and the direction of cell-walls have been carefully noted. In case the plant is a complex one,

GERMINATION.

1, Young prothallium of a fern; 2, three stages in the germination of a green alga, beginning with the spore (a); 3, young plants of a liverwort developing from spores within the sporangium.

after a certain number of cells have been developed, the different regions of the body begin to appear. For example, in an embryonic seed-plant it would be impossible for a time to tell what kind of plant is to develop, but after a

homogeneous cell-mass of greater or less extent is formed, the organs begin to appear which determine the character of the plant.

In the case of alternation of generations (q.v.) the germination of the sexual spore (fertilized egg) results in a sexless plant (sporophyte); while the germination of the asexual spore results in a sexual plant (gametophyte). Among the heterosporous plants (those producing two kinds of asexual spores), that is, in certain fern-plants and all the flowering plants, the sexual plants (gametophytes) do not escape from the spores which germinate them. For example, the pollen-grain is a spore which by its germination produces a male gametophyte, but this gametophyte is so much reduced that it is represented only by a few cells or nuclei within the pollen-grain. The same is true of the germination of the megaspore in seed-plants, which is retained within the ovule, and which in its germination develops the so-called endosperm, which is the female gametophyte. With the exception of heterosporous plants, however, the germinating plantlet soon escapes from the spore.

In the so-called germination of the seed there are numerous events which may be observed. Attention has been called already to the fact that this process is not technically germination, but merely the renewal of activity, and the escape of the young plantlet. Just how long different seeds may retain their vitality in a state of suspended animation is not definitely known. Some seeds have renewed activity after having remained in a dried-up condition for many years, but such stories as that the wheat taken from the wrappings of Egyptian mummies has been

to germinating, as in the process of malting, the heat may become very evident. The first part to protrude from the seed is the hypocotyl (q.v.), the tip of which is thrust out by the rapid elongation of its upper part. This protruding and rapidly elongated tip, which is to develop the root, now rapidly increases in length, and is very sensitive to the influence of gravity and of moisture, responding by developing any curvature necessary to reach the soil. Penetrating the soil and beginning to put out lateral branches, it secures the grip necessary for the extrication of the other regions of the embryo. After some anchorage has thus been obtained, the upper part of the hypocotyl again begins a period of rapid elongation, which results in the development of a curvature known as the hypocotyl arch. In the case of the germinating bean this arch is the first structure to appear above ground, and its pull upon the seed is very apt to bring it to the surface. Finally, the arch in its effort to straighten pulls the cotyledons out of the seed-coats, and with them the stem-tip, the axis of the plant straightens up, the seed-leaves and sometimes other leaves expand, and germination is over; for, with roots in the soil, and green leaves expanded to the air and sunlight, the plantlet has become independent. These details are not the same for all seeds, for there are certain notable variations. For example, in the pea and acorn the cotyledons are so gorged with food as to have lost all power of acting as leaves, and are never extricated from the seed-coats. In the cereals, as corn, wheat, etc., the embryo lies close against one side of the seed, so that it is completely exposed by the splitting of the thin skin which covers it. In such a case the cotyledon is never unfolded, but remains as an absorbing organ, while the root extends in one direction and the stem with its succession of ensheathing leaves develops in the other.

GERMINIE LACERTEUX, zhâr'mé'né' lá'sâr'té'. A realistic romance by Edmond and Jules de Goncourt (1865), in which the authors aim to present, as they say, a 'clinic of love.' The story is that of a poor country girl who comes to Paris, and through the fault of another is launched upon a career to the dangers of which her temperament renders her peculiarly liable, and which finally brings her to death on a hospital cot. The study is based on actual observation by the authors. It was dramatized by Edmond de Goncourt, and produced at the Odéon in 1889.

GERM-PLASM. The kind of protoplasm supposed by some embryologists peculiar to the germinal part of the ovum and regarded as containing such chemical or molecular composition and properties as to determine the special character of the resulting organism. This singularity is supposed to be inherited and so continue from generation to generation.

GERNSHEIM, gërns'hîm, FRIEDRICH (1839—). A German composer. He was born at Worms, and studied at Mainz (under Pauer), Frankfurt-on-the-Main, at the Leipzig Conservatory, and in Paris. After conducting at Saarbrücken (1861-65) he was called to the Conservatory of Cologne, where he also conducted several musical societies, and in 1873 was appointed to the leadership of the opera orchestra. He was afterwards long associated, as the successor of Bargiel, with the Conservatory at Rotterdam, where he

GERMINATION.

1, Development of Botrydium (alga) from the egg; 2, egg-mentation of egg of a brown alga; 3, a young fungus coming from the egg; 4, young prothallium of Equisetum.

made to germinate are myths. Seed-germination results in freeing the embryo from the seed-coats, and in enabling it to establish itself for independent living. The first conspicuous change noted in the seed after the absorption of water is the softening of the contents, the solid or insoluble starch, if that be the form of the food storage, being converted by a process of digestion into soluble sugar ready for transfer. Accompanying this change there is a marked evolution of heat, so that if a large mass of seeds is set

also conducted the famous 'Winter Concerts,' and after 1890 was conductor of the Stern Choral Society in Berlin, one of the most prominent singing societies of Germany. His compositions include symphonies, overtures, choral works, and a great variety of chamber music.

GERO, gá'ró. A German hero in the *Nibelungenlied*. He is an historic character who, as Margrave of the Ostmark, in 939, conquered all the Slavic tribes between the Elbe and the Oder, and died in 965.

GEROK, gá'rók, KARL (1815-90). A German preacher and religious poet. He was born at Vaihingen, Württemberg, January 30, 1815, studied at Tübingen, became chief Court preacher in Stuttgart, 1868, and died there January 14, 1890. His sermons, and particularly his religious poetry, were much admired. The chief collection of the latter was entitled *Palmbblätter* (1857), English translation by Brown (London, 1869).

GÉRÔME, zhá'róm', JEAN-LÉON (1824-1904). A French painter and sculptor, one of the most eminent artists of the nineteenth and early twentieth centuries. He was born May 11, 1824, at Vesoul, Haute-Saône, France. His father, a goldsmith, encouraged the artistic tendencies of his son. Léon's copy of a picture by Decamps was seen by a friend of Delaroche, which led to Gérôme's entering the atelier of that master in Paris, at the age of fifteen. Three years later he went with Delaroche to Rome. With the exception of a few months with Gleyre, all Gérôme's early training was received from Delaroche. He assisted Delaroche on his picture of "The Passage of the Alps by Charlemagne," now in the Versailles Museum. In 1847 Gérôme was unsuccessful in the competition for the Prix de Rome, but the picture, a "Greek Cockfight," now in the Luxembourg, which he exhibited at the Salon of that year, was the sensation of the day. This picture was followed by the "Anacreon, Bacchus, and Cupid" (1848), now in the Museum of Toulouse. In 1848 he won the second-class medal at the Salon. In 1850 he exhibited the "Greek Interior," and in 1855 the "Age of Augustus," an immense picture now in the Museum of Amiens.

All the most splendid qualities of the art of Gérôme appear in the great picture of "Morituri te Salutant" (the "Gladiators Before Cæsar"), which was exhibited in 1859. In 1854 Gérôme visited the Danube provinces, and in 1857 Egypt, stopping at Constantinople on the way. He was made professor of painting at the Ecole des Beaux-Arts in 1865, and won a medal of honor at the University Exposition of 1867. He was made chevalier of the Legion of Honor in 1855, officer in 1867, and afterwards commander.

Gérôme painted an enormous number of pictures, which are largely held in the museums of France. A partial list only can be given. He exhibited the "Phryne Before the Tribunal" in 1861; "The Two Augurs" and the portrait of Rachel in 1861; the "Cleopatra and Cæsar" in 1866; the "Slave Market" and the "Death of Cæsar" in 1867; and the "Promenade in the Harem" in 1869. He painted the "Plague at Marseilles" as a decoration in one of the chapels of the Church of Saint-Séverin in Paris.

Gérôme exhibited his great picture "Pollice Verso," companion to the "Gladiators Before Cæsar," in 1873. These two pictures were considered by the painter himself his best works.

Of his later pictures the most important are: "Eminence Grise" (1876); "Rex Tibicen," "Frederick the Great Before the Bust of Voltaire" (1876); "Saint Jerome" (1878); "Slave Market in Rome" (1884); "Great Bath at Brusa" (1885).

At the Universal Exposition in Paris in 1878, Gérôme made his début as a sculptor of the first rank. He reproduced in bronze, and larger than life, the central group of the "Pollice Verso," a gladiator standing over his conquered antagonist, and awaiting the signal of the Vestal Virgins, the thumb turned down, which was, according to a supposition now superseded, the death-sign in the arena. The best of Gérôme's later work is in sculpture. The most characteristic is a series of bronze equestrian statuettes, among which are "The Entry of Bonaparte into Cairo," "Frederick the Great," and "Tamerlane." Consult: Claretie, *Peintres et sculpteurs contemporains* (Paris, 1884); Cook, *Art and Artists of Our Time*, vol. i. (New York, 1888); Low, "Gérôme," in Van Dyke, *Modern French Masters* (ib., 1896).

GERONA, há-ró'ná. The capital of the province of the same name, Spain, 52 miles northeast of Barcelona, situated on both sides of the river Oñar, near its confluence with the Ter (Map: Spain, G 2). Built at the foot and on the slope of two hills, the fortified Monjuich commanding the city, it comprises two parts, the city proper with the narrow, dingy streets of a mediæval town, which nevertheless has the finest architectural features, and the suburb, El Mercadel, presenting a modern appearance. The rivers Güell and Galligans empty into the Oñar, the former just north of the city, while the latter flows through it, and many of the houses are built directly on the river's brink—a circumstance that has caused the floods, particularly those of 1762 and 1829, to be extremely disastrous. Gerona still retains part of its old walls, and has plazas and promenades; but its chief attractions are in its churches. The noble Gothic cathedral stands on the site of an earlier church dedicated in 1038, the modern edifice having been begun in 1416; the nave, 73 feet in width, is one of the widest Gothic vaults in the world. Also noteworthy are the churches of San Felix and San Pedro. There are a large poor-house, a hospital in connection with which is an insane asylum, and two public libraries, the provincial library having over 13,000 volumes. The citadel serves as a State prison. The manufactures of the city, which comprise paper, textiles, cork, etc., are increasing in importance; and in the vicinity coal, iron, copper, and lead are mined. There are also mineral springs. Population, in 1900, 15,668.

Gerona, the ancient Gerunda, is one of the oldest cities of Spain, its origin being ascribed to the tenth century B.C., though it appears first in history during the Punic Wars. In the Middle Ages it was known also as Gironda. The town submitted to the Moors in 717 and in 797 came finally into the possession of the Frankish borderers, who for a time ruled it in the name of their kings. Subsequently it passed into the possession of the counts of Barcelona. It was erected into a dukedom about the middle of the fourteenth century, and in 1414 into a principality for the eldest son of the King of Aragon. Gerona played a part in the War of the Spanish

Succession, suffering severely with the rest of Catalonia. It became celebrated for the stubborn fighting qualities of its inhabitants. Its crowning exploit was achieved in 1809 in the Spanish War of Liberation, when it held out from June 8th to December 10th against the French, who had invested it in the preceding year, yielding only when its citizens succumbed to famine and disease. The French loss during the siege was estimated at 15,000.

GERONIMO. A chief of the Chiricahua tribe of Apache Indians in North America. During 1884-85 Geronimo had surrounded himself by a band of hostile Indians, who terrorized a great part of New Mexico and Arizona. Against them, early in 1886, General Sheridan sent Gen. George Crook, who had already won considerable renown as an Indian fighter. In March a truce was made, followed by a conference between Crook and Geronimo, at which terms of surrender were agreed upon. Before they could be carried out, however, the Indians escaped to the mountains, and General Crook was superseded in command by Gen. Nelson A. Miles. General Miles immediately began an active campaign against the Indians. He followed them into the mountains, and gave them no rest, until at length Geronimo was glad to make peace, and to accept the terms offered by General Miles, which provided for the deportation of Geronimo and his leading followers to Fort Pickens, Fla., and their personal detention there.

GÉRONTE, zhà'rônt'. In French classical comedy, a type of the old man, originally simply a father, without comic features. The character appears especially in Corneille's *Le menteur*, in Molière's *Le médecin malgré lui* and *Les fourberies de Scapin*, and in Regnard's *Le joueur*, *Le retour imprévu*, and *Le légataire universel*. In the *Menteur* the character has dignity and restrained emotion. In the *Médecin malgré lui* and the *Fourberies* he has become purely a grotesque dupe, miserly, obstinate, and credulous, and an easy prey for his rascally valet.

GERRARD, jê-rârd'. (1) The name of the 'King of Beggars' in Beaumont and Fletcher's *Beggar's Bush*, which he temporarily exchanges for the alias of Clause. (2) The youthful intriguer in Wycherley's *Gentleman Dancing-Master*, who conducts a flirtation by assuming the disguise of a dancing-master.

GERRESHEIM, gër'es-hîm. A town in the Rhine Province, Prussia, 4 miles west of Düsseldorf. It is an industrial centre of growing importance, with extensive glass-factories and other manufacturing establishments. Its Romanesque parish church dates from the thirteenth century. Population, in 1900, 11,541.

GERRY, gër'ri. ELBRIDGE (1744-1814). An American statesman. He was born at Marblehead, Mass., July 17, 1744, the son of a merchant. He graduated in 1762 at Harvard, where three years later he took a master's degree, and, abandoning his original intention of entering the medical profession, became a successful merchant in his native town. In May, 1772, he entered upon his long political career as a member of the General Court of Massachusetts, and here immediately identified himself with the Patriot Party, particularly as represented by Samuel Adams, with whom from this time forward he

was closely associated in opposition to the arbitrary measures of the British Ministry. He was reelected in 1773; was soon afterwards appointed by the Legislature, with Hancock and Orne, a member of the Committee of Correspondence; and in 1774 and 1775 was a prominent member of the Massachusetts Provincial Congress, by which, after the battle of Lexington, he was charged with procuring a supply of gunpowder for the Province, and before which late in 1775 he introduced a bill, passed on November 10th, for arming and equipping ships for aggressive service against the British mercantile and military marine. This bill, says Gerry's biographer, Austin, was "the first actual avowal of offensive hostility against the mother country which is to be found in the annals of the Revolution," and the "first effort," as well, "to establish an American naval armament." Samuel Adams spoke of it as "one of the boldest, most dangerous, and most important measures . . . in the history of the New World, the commencement of a new maritime and military power." In 1776 Gerry was elected to the Continental Congress, in which he served for the next four years, during which time he took an active part in securing the passage of many measures of importance, was a member of various important committees, and in particular was conspicuous as a vigorous advocate of the Declaration of Independence, which he signed. He was also prominent as a member of three committees appointed (in September, 1776, July, 1777, and November, 1777) to visit Washington's camp on behalf of Congress, and more especially as a member of a standing committee for superintending the treasury, of which he was for some time chairman, and which exercised a virtual control over the finances of the country throughout the Revolutionary War. He was accused, but apparently with little justice, of supporting, or at least countenancing, the Conway Cabal (q.v.) in its efforts to displace Washington; and in 1779, as head of the treasury board, came into conflict with Gen. Benedict Arnold, some of whose accounts he had refused to audit. In February, 1780, he withdrew from Congress owing to its refusal to record the yeas and nays on a question of order raised by him, and the Massachusetts General Court, to which he appealed, sustained him in his position. On his return to Massachusetts he was elected a member of both the Upper and the Lower House in the first Legislature under the new State Constitution, and accepted a seat in the latter.

In 1783 he resumed his seat in the Continental Congress, which he retained for three years, during which time he was a member of the committee appointed, in 1783, to consider the definitive treaty of peace, was chairman of each of two committees appointed to choose a suitable location for a national capital, and again took a prominent part in the initiation and discussion of financial measures. He was also conspicuous in 1784 as an opponent of the Society of the Cincinnati. He again became a member of the Lower House of the State Legislature in 1785; declined an appointment to the Annapolis Convention (q.v.) in 1786; and in 1787 was sent as one of the Massachusetts delegates to the Constitutional Convention at Philadelphia, where he was prominent as an opponent of the Constitution as finally

adopted, refusing, along with Randolph and Mason, to affix his signature. His chief objections, as stated by himself, were, "that there is no adequate provision for a representation of the people; that they have no security for the right of election; that some of the powers of the Legislature are ambiguous and others indefinite and dangerous; that the Executive is blended with and will have an undue influence over the Legislature; that the judicial department will be oppressive; that treaties of the highest importance may be formed by the President, with the advice of two-thirds of a quorum of the Senate; and that the system is without the security of a bill of rights." After the organization of the Government he was elected one of the representatives of Massachusetts in the first and second Congresses under the Constitution. Subsequently he remained in retirement at Cambridge until 1797, when, war with France appearing imminent, he was sent, along with Marshall and Pinckney, on an important mission to the French Directory. The envoys, unable to secure official recognition, were forced to submit to various indignities and humiliating rebuffs, while disgraceful propositions were made to them by Talleyrand and his secret agents; and Marshall and Pinckney soon left in disgust. Gerry, however, being the only Republican on the commission, and therefore being, presumably, more favorably disposed than his colleagues toward the French Government, remained for some time longer, at the request of Talleyrand, but accomplished nothing. (See X Y Z CORRESPONDENCE.) For thus remaining he was acrimoniously attacked by the Federalists upon his return to the United States. He was several times defeated for Governor of Massachusetts, but was successful in 1810, and in 1811 was reelected. His administration was fiercely criticised by the Federalists on the ground of its alleged partisanship, and color was given to the charge by the enactment by the Republican Legislature of a law, which Gerry signed, but of which he seems to have disapproved, for redistricting the State in such a manner as to annihilate the Federalist majorities in several counties. (See GERRYMANDER.) From 1813 until his death he was Vice-President of the United States. He died suddenly on November 23, 1814, and in 1823 a monument was erected to his memory by order of Congress. He married the daughter of Mr. James Thompson of New York City, and left a family of three sons and six daughters. Consult Austin, *Life of Elbridge Gerry, with Contemporary Letters* (Boston, 1828-29).

GERRY, ELBRIDGE THOMAS (1837—). An American lawyer and philanthropist, born in New York City, a grandson of Elbridge Gerry (q.v.). He graduated at Columbia College in 1857. During his practice as a lawyer he accumulated one of the finest libraries of works on jurisprudence in America. He became prominently connected with numerous reformatory and benevolent organizations, and in 1874 founded the Society for the Prevention of Cruelty to Children. In 1886 he was chairman of the commission which advocated the abolition of the gallows and the substitution of electricity for capital punishment in New York.

GERRYMANDER, gér'ri-mán'dér. A word belonging to the political vocabulary of the United States, and used to denote an unfair di-

vision of the electoral districts in a State, made in the interest of one of the political parties. The word was coined in 1812, though the practice probably originated earlier. At that time the Federalist and Republican parties in Massachusetts were nearly evenly balanced in numerical strength, but the Republicans took advantage of a temporary majority in the Legislature to divide the State into new Senatorial districts in such a manner that those sections which gave a large number of Federalist votes might be brought into one district. Previously each county had constituted a Senatorial district, and the power of rearranging old districts or creating new ones, bestowed on the Legislature by the State Constitution, had never been exercised. Elbridge Gerry (q.v.) was at that time Governor, and through his signature, though he seems not to have wholly approved the measure, the work of the Legislature became a law. The form of one of the districts into which Essex County was divided was somewhat like that of a monstrous animal, and when some one suggested that it looked like a salamander, the name 'gerrymander' was given to it, instead. The passage of the law caused a great outcry from the Federalists, and early in 1813, this party having again secured a majority and elected a Governor (Caleb Strong) to succeed Gerry, the law was repealed. The device, however, has since been repeatedly used in various States. For an account of the origin of the term, consult Dean, "The Gerrymander," in the *New England Historical and Genealogical Register*, vol. xlv. (Boston, 1892):

GERS, zhâr. An interior department in the southwest of France, formerly portions of the provinces of Gascony and Guienne (Map: France, G 8). Area, 2425 square miles. Population, in 1896, 246,647; in 1901, 238,448. While the surface is hilly, its highest point does not exceed 1300 feet. Its principal rivers are the Gers, the Adour, Save, Gimone, and Bayse. Over 15 per cent. of the surface is devoted to the cultivation of the grape, from which large quantities of ordinary brandy and wine are manufactured. Wheat, oats, and flax are extensively grown. Other manufactures besides brandy and wine are woolens, leather, porcelain, glass, and bricks. Capital, Auch.

GERSAU, gër'sou. A health resort of Switzerland, situated in the Canton of Schwyz on the northern bank of Lake Lucerne (Map: Switzerland, C 2). The situation of the place is very picturesque and its equable and mild climate makes it a very desirable resort for invalids. The total population of the commune is about 2000. For four centuries after 1390 Gersau was entirely independent, forming the smallest republic in Europe. At the formation of the Helvetic Republic in 1798 Gersau became a part of the Canton of Waldstätten, and was subsequently (1803) incorporated with the Canton of Schwyz. Population, in 1888, 1816; in 1900, 1887.

GER'SHOM, or **GER'SHON**. A name given to two individuals in the Old Testament. (1) The first-born son of Moses and Zipporah, according to Ex. ii. 22; xviii. 3. In Judges xviii. 30, Gershom, or Gershon, is said to be the father of Jonathan, the priest officiating at the sanctuary of Dan (see HIGH PLACE), and the son of Manasseh or Moses. The only difference between these two names when written with the Hebrew

characters is the letter *nun*. While Manasseh is found in many manuscripts, most frequently the *nun* is put above the line, and in some cases it has been added by a later hand. Most of the ancient versions read Manasseh; but some manuscripts of the Greek version and the Latin Vulgate read Moses. It is therefore difficult to determine what the original reading was. Evidently the priesthood at Dan traced its origin either to Manasseh or to Moses, or to both at different periods. As the thirteen cities assigned to the Levitic clan of the Gershonites were all in Eastern Manasseh, Issachar, Asher, and Naphtali (Josh. xxi. 27, 33), it is possible that the Gershonite priesthood at Dan considered itself of Manassite origin, and even that the cult in this place was once devoted to the divinity who afterwards became the eponymous hero of the tribe of Manasseh. A claim to Mosaic descent would then be a later development. Another view is that the suspended *nun* is a device to gloss over the unpleasant fact that a grandson of Moses was priest at a temple where a Yahweh image was worshipped. The priestly legislation knows of no sons of Moses in the priesthood. (2) The first-born son of Levi, according to Ex. vi. 16; Num. iii. 17; I. Chron. vi. 1, 16; xxiii. 6. In reality this Gershon is the eponym of a Levitic family in the Persian and Greek period. In the sketch of the tabernacle in the wilderness, the Gershonites are the carriers of curtains, coverings, screens, and hangings belonging to this movable sanctuary. In the narrative of David's reign they figure as musicians belonging to the family of Asaph. It is probable that the Gershonites furnished some of the musicians as well as some of the janitors for the second temple. Whether they were descendants of the Gershonites who once were priests at Dan is not certain, but it is quite probable.

GERSON, zhâr'sôn', JEAN CHARLIER DE (1363-1429). An eminent French scholar and divine of the closing period of the Middle Ages. He was born at Gerson, in the Diocese of Rheims, December 14, 1363. He entered the University of Paris, and studied theology under the celebrated Pierre d'Ailly. Here he rose to the highest honors of the university, and ultimately to its chancellorship (1392), having acquired by his extraordinary learning the title of 'the Most Christian Doctor.' During the contests which arose out of the rival claims of the two lines of pontiffs in the time of the Western Schism (q.v.) the University of Paris took a leading part in the negotiations for union, and Gerson was one of the most active supporters of the proposal of the university for putting an end to the schism by the resignation of both the contending parties. He visited the other universities, in order to obtain their assent to the plan proposed by that of Paris. But although he had the satisfaction to see this plan carried out in the Council of Pisa (1409), it failed to secure the desired union. In a treatise inscribed to his friend Pierre d'Ailly, he renewed the proposal that the rival pontiffs (now not two, but three, since the election of John XXIII., at Pisa) should be required to resign; and in the new council which met at Constance in 1414, he was again the most zealous advocate of the same expedient of resignation. It is to him also that the great outlines of the plan of Church reformation, then and afterwards proposed, are due. (See CONSTANCE, COUNCIL OF.)

But his own personal fortunes were marred by the animosity of the Duke of Burgundy and his adherents, to whom Gerson had become obnoxious, and from whom he had already suffered much persecution, on account of the boldness with which he had denounced the murder of the Duke of Orleans. To escape their vengeance, he was forced to remain in exile; and he retired from Constance (1418) in the disguise of a pilgrim, to Rattenberg, in Bavaria, where he composed his celebrated work, *De Consolatione Theologicæ*, in imitation of that of Boëthius, *De Consolatione Philosophiæ*; later he went to Neuburg. It was only after the lapse of two years that he was enabled to return to France and take up his residence in a monastery at Lyons, of which his brother was superior. He devoted himself in this retirement to works of piety, to study, and to the education of youth. He died in Lyons July 12, 1429. His works fill five volumes in folio. Among the books formerly ascribed to him was the celebrated treatise *De Imitatione Christi*; but it is no longer doubtful that the true author is Thomas à Kempis (q.v.). The best and most complete edition of his works is by Dupin (Antwerp, 1706). Consult: his life by Schwab (Würzburg, 1858); Bess, *Zur Geschichte des Konstanzer Konzils* (Marburg, 1891); Creighton, *History of the Papacy*, vols. i. and ii. (London, 1882).

GERSON, gër'son-y', WOJCIECH (1831-1901). A Polish historical painter, born at Warsaw. He began his studies at the School of Art, and continued them at the Academy of Saint Petersburg, and under Léon Cogniet in Paris. Subsequently appointed professor in his native city, he exercised a far-reaching influence upon the promotion of art in Poland as the master of many of the distinguished Polish painters of the day, and as the founder of the Art Society in Warsaw. He was a member of the Saint Petersburg Academy. Among his highly valued pictures, noted for thoughtful conception and masterly finish, may be mentioned: "Conversion of the Slavs to Christianity in the Tenth Century;" "Queen Hedwig in the Castle at Cracow;" "Count Casimir the Righteous;" "Copernicus in Rome;" "Haughty Queen Rixa of Poland," besides many other episodes from Polish history.

GERSONIDES, gër-sôn'î-déz, or LÉON DE BAGNOLS (c.1288-1344). A distinguished Jewish philosopher, physician, astronomer, and commentator, known in Jewish literature as Levi ben Gerson. He was born in Arles, of a family of scholars. He made many accurate observations in astronomy, and wrote commentaries on parts of the Bible. His best work is called *Milkhamot Adonai*, "Wars of the Lord," and is a daring philosophical treatise. Though his philosophy is based on that of Maimonides, it passes beyond this writer in various points. His works gained a reputation among Christian scholars, and certain portions were translated into Latin by order of Pope Clement VI. (1342). He died at Perpignan. Consult: Joel, *Levi ben Gerson als Religionsphilosoph* (Breslau, 1862); Winter and Wänsche, *Jüdische Litteratur*, vol. ii. (Treves, 1894).

TERSOPPA (gër-söp'pâ) **FALLS**. A celebrated cataract on the Sharawati River, India, 30 miles southeast of Honawar at the mouth of the river on the west coast (Map: India, B 6).

It consists of four falls known as the Great, the Roarer, the Rocket, and the *Dame Blanche* or White Lady, names descriptive of their general features. They descend on three sides of an immense chasm 600 feet wide, the Great Fall leaping down 829 feet into an enormous pool of great depth.

GERSTÄCKER, gër'stèk-ër, FRIEDRICH (1816-72). A German romancer of adventure. Born in Hamburg, May 10, 1816, the son of an opera singer, and left early an orphan, he came to the United States in 1837, and for seven years wandered over the country supporting himself as a jack of all trades and for some time as a hunter. In 1843 he returned to Germany and turned his experiences to profitable account in the widely popular *Streif- und Jagdzüge* (1844); *Die Regulatoren in Arkansas* (1846); *Die Flusspiraten des Mississippi* (1848); and many other volumes of similar character. In 1849 Gerstäcker went again to America and visited also Polynesia and Australia, basing on this voyage his *Tahiti*, and an Australian story, *Die beiden Sträflinge*, both of which are among his best work. In 1860 he went to South America, and in 1862 accompanied Duke Ernest of Saxe-Coburg-Gotha to Egypt and Abyssinia. In 1867-68 he revisited the United States, traveling also in Mexico, Ecuador, Venezuela, and the West Indies, and he gave a vivid account of his experiences in *Neue Reisen* (1868), and in several novels, *Die Missionäre* (1868), *Die Blauen und die Gelben* (1870), and others. Gerstäcker's gifts of description are very considerable, his character drawing is vivid and realistic, his style straightforward and unstudied. Many of his stories have been popular in English translations. He died in Brunswick, May 31, 1872.

GERSTÄCKER, KARL EDUARD ADOLF (1828-95). A German zoölogist. He was born and educated in Berlin, where in 1857 he was appointed lecturer on zoölogy at the university and director of the entomological collection in that institution. During the last twenty years of his life he was professor of zoölogy at Greifswald. His principal works include: *Entomographien* (vol. i. 1858); *Zur Morphologie der Orthoptera Amphibiotica* (1873); *Die Wanderheuschrecke* (1876); and *Der Coloradokäfer* (1877).

GERSTENBERG, gër'sten-bèrk, HEINRICH WILHELM VON (1737-1823). A German poet, dramatist, and critic, born at Tondern (Schleswig). He was educated at Jena, entered the Danish Army, became a captain of cavalry in 1763, and in 1766 was retired from the service on half pay. In 1771 he resigned, in 1775 was appointed Danish consul at Lübeck, and from 1785 to 1812 was legal director of the royal lottery at Altona. He is known for three works of important influence in German letters. His *Gedicht eines Skalden* (1766) introduced a revival of the literary use of Teutonic mythology and the heroic age of German civilization. His tragedy *Ugolino* (1768), based on Dante, though declared by Lessing essentially undramatic, attracted much attention by its skillful management of plot and character. His *Briefe über Merkwürdigkeiten der Litteratur* (1766-70) contributed much in Germany toward a just estimate of Shakespeare, and by its complaint against the reigning formality in German literature indirectly helped to prepare the way for the 'Sturm und Drang.' A

collection of his *Vermischte Schriften*, edited by himself, appeared in 1815.

GERSTER, gër'stër, ETELKA (Mme. GARDINI) (1857—). A Hungarian singer, born at Kaschau. After studying at the Vienna Conservatory under Marchesi she made her début in 1876 as Gilda in *Rigoletto*, subsequently singing with great success in Marseilles, Genoa, and Berlin. In 1877 she married Pietro Gardini. The following year (and again in 1883 and 1887) she made a tour of the United States, and also sang in the principal European cities. Her voice, a high soprano, was remarkable for its great flexibility and brilliancy. In 1896 she opened a singing school in Berlin.

GERSTNER, gër'st'nër, FRANZ ANTON VON (1793-1840). An Austrian engineer, a son of Franz Josef von Gerstner (1756-1832). He was born and educated at Prague, and in 1818 was appointed professor of practical geometry at the Polytechnic Institute, Vienna. He went to England several times to investigate railroad-building in that country, especially the road from Liverpool to Manchester, which was at that time in course of construction. In 1823-24 he made the plans of the Budweis-Linz (horse-power) Railroad, the first to be constructed on the Continent of Europe (opened 1832). He built the road from Saint Petersburg to Tsarskoye-Selo, and organized other railroads in Russia. In 1838 he visited America, where he examined the railroads then either built or building in the United States. Two years after his sudden death in Philadelphia, a description of his American tour was published by his wife under the title *Beschreibung einer Reise durch die Vereinigten Staaten von Nord-Amerika* (1842). A similar work, but more technical in character, embodying the investigations of Gerstner in America, was edited in 1842 by L. Klein, under the title *Die inneren Kommunikationen der Vereinigten Staaten von Nord-Amerika*, an interesting work in two volumes on the means of communication then existing in the United States.

GERTRUDE. (1) A Belgian saint (626-59), whose fête is celebrated on March 17th. She was the daughter of Pepin of Landen and Ida of Aquitaine. Dagobert I. attempted to force her to marry him, but she eluded his efforts and, taking the veil, became abbess of Nivelles in Brabant. A number of churches in Belgium are dedicated to her. (2) SAINT GERTRUDE of Eisleben (1256-1311) entered the Convent of Helfta when five years old and became a great student. Her mystical visions began in 1271, and from that time she gave herself particularly to the study of the Scriptures. Her visions she describes in *Insinuationes Divinæ Pietatis* and *Exercitia Spiritualia* (1602), often reprinted. Her fête is kept on November 15th.

GERTRUDE. (1) The weak-minded Queen of Denmark in Shakespeare's *Hamlet*, who marries the fratricide Claudius, and is poisoned by a deadly draught prepared for her son. (2) The extravagant goldsmith's daughter in Chapman, Marston, and Jonson's *Eastward Ho!*

GERTRUDE OF WYOMING. A pathetic and graceful, though not flawless, poem by Thomas Campbell which appeared in 1809, and suggested a notable conversation between Scott and Irving concerning the author's limited poetic achievements in proportion to his undoubted powers and promise.

GERUSALEMME LIBERATA, jā-rōō'sā-lēm'mā lē'bā-rā'tā (lt., Jerusalem Delivered). A famous poem by Torquato Tasso (1581), in 24 books, the narrative of real and fictitious events connected with the First Crusade and the deliverance of Jerusalem under Godfrey of Bouillon. English translations were published by Fairfax in 1600 and by James in 1865.

GÉRUZEZ, zhā'rōō'zā', EUGÈNE (1799-1865). A French critic, born at Rheims. He was the nephew of Jean Gérúzez (1763-1830) the author, and held the chair of eloquence at the Sorbonne for nineteen years. Besides his contributions to the best journals of the time, he wrote a number of valuable critical works, such as *Histoire de l'éloquence politique et religieuse en France au XIVème, XVème et XVIème siècles* (1837-38); *Essais d'histoire littéraire* (1838); *Histoire de la littérature française pendant la Révolution* (1859); and *Histoire de la littérature française depuis ses origines jusqu'à la Révolution* (1861).

GERVAIS, zhār'vā', ALFRED ALBERT (1837—). A French admiral, born at Provins. After serving in the Crimean, Chinese, and Franco-German wars, he was appointed captain in 1871. In 1884 he became chief of staff in the Naval Department at Paris, and three years later was advanced to the rank of rear-admiral. He was appointed vice-admiral in 1892, commanding admiral of the Mediterranean squadron in 1896, and in 1900 commanded the canal squadron which received the Czar at Dunkirk.

GERVAIS, FRANÇOIS LOUIS PAUL (1816-79). A French paleontologist, born in Paris. He graduated there as doctor of sciences and of medicine, and in 1835 was appointed assistant to Blainville, professor of comparative anatomy at the Paris Museum. In 1845 he became professor of zoölogy and comparative anatomy in the Faculty of Sciences of Montpellier, in 1865 a professor in the Faculty of Sciences of Paris, and in 1868 professor of comparative anatomy at the Museum. He was appointed a correspondent of the Institute of France in 1861, and elected a foreign member of the Geological Society of London in 1875. He early began the study of the 'insecta aptera' of Linnaeus, particularly the myriapods, and prepared the *Histoire naturelle des insectes aptères* (1844-47), comprising volumes three and four of the *Suites à Buffon* begun by Walckenaer. It is however, for his researches concerning the Tertiary mammalia that he is best known. In this field his most important contributions are his *Histoire naturelle des mammifères* (1854-55), and *Zoölogie et paléontologie générales* (1867). The *Recherches sur les mammifères fossiles de l'Amérique Méridionale* (1855) should also be mentioned.

GERVASE (jēr'vāz) OF CANTERBURY (1141?-1210?). An English chronicler. He became a monk of Christ Church, Canterbury, in 1163, and sacristan in 1193, and seems to have spent all the rest of his life there. His earliest known work is a *Tractatus de Combustione et Reparatione Cantuariensis Ecclesie*, being an account of the conflagration of 1174, and of the subsequent process of rebuilding, written probably in 1185. This was followed by *Imaginatio Gervasi Quasi Contra Monachos Cantuariensis Ecclesie*, and other treatises containing a detailed relation of the clerical disputes at Canterbury. Gervase's *Chronica* of the times of Stephen,

Henry II., and Richard I., probably begun about 1188, brings the history down to the death of the last-named King. His *Actus Archiepiscoporum Cantuariensium* comes down to the death of Hubert Walter in 1205. His *Gesta Regum* extends from Brutus to 1210, and is continued by another author to 1328. In addition, he wrote a *Mappa Mundi*, a survey of the counties of England. Gervase died, probably, very soon after 1210. All of his works have been edited by Stubbs, in two volumes, Rolls Series (1879-80). The preface contains a full account of his life.

GERVASE OF TIL'BURY. A mediæval writer on historical and philosophical subjects, born probably at Tilbury, in Essex, England. He seems to have been brought up in Italy, and to have studied and taught at Bologna. He was at Venice in 1177 when Frederick I. and Alexander III. met. He was at the English Court about 1183, and later went to Sicily. In 1190 he was at Salerno. He entered the service of Otho IV., who made him Marshal of the Kingdom of Arles, and to whom he dedicated his only extant work, the *Otia Imperialia*. This was written about 1211-1214, and is divided into three parts. In the first Gervase discusses the events in the early chapters of Genesis, the origin of music, etc.; in the second he treats of history, geography, and politics; in the third, of marvels. The last is exceedingly valuable for the light it throws upon the beliefs of the age. This work was published (although not completely) in Leibnitz, *Scriptores Rerum Brunsvicensium* (Hanover, 1707-10).

GERVEX, zhār'vā', HENRI (1848—). A French painter, born in Paris. He was the pupil of Cabanel, Brisset, and Fromentin, and first exhibited in 1873. His "Satyr Playing with a Bacchante" (1874) is in the Luxembourg. After this date his works were more often of contemporary life. These include "Communion at the Church of the Trinity;" "Rolla," a fine nude, excluded from the Salon of 1878; "The Return from the Ball;" and "Dr. Péan at l'Hôpital Saint Louis," a realistically treated scene in an operating room, one of the first works in this genre to be represented in modern art. In this, as in all his works, the technique is excellent, and the color quiet and harmonious. With Blanchon he produced four decorative paintings of civil subjects for the Mayor's office of the nineteenth arrondissement. His portraits are notable; particularly "The Séance of the Jury of Painting" (1885) in the Luxembourg. He received second-class medals in 1874 and 1876, and was decorated with the cross of the Legion of Honor in 1889.

GERVINUS, gēr-vē'nōōs, GEORG GOTTFRIED (1805-71). A German historian and literary critic. He was born at Darmstadt, May 20, 1805, studied, after some years devoted to commercial pursuits, at Giessen and Heidelberg, taught at Frankfort, and became professor at Heidelberg in 1835 and at Göttingen in 1836. He had already printed some historical work of minor value, but now began the publication of what came at last to be known as his *Geschichte der deutschen Dichtung* (1835-42), which has passed through many editions. In 1837 he, in common with six other liberal professors, lost his chair by a protest against the suspension of the Hanoverian Constitution, was banished, and traveled for a time in Italy. In 1844 he received a call

to Heidelberg as professor. Some years were now given to political writing in pamphlets and periodicals in the interest of constitutional liberty, but the failure of liberal hopes in 1848 brought him back to literature. He wrote four volumes on *Shakespeare* (1849-50); a liberal and very influential *Geschichte des neunzehnten Jahrhunderts* (1853-66); *Händel und Shakespeare* (1868); and *Händel's Oratorientexte* (1873). He died at Heidelberg, March 18, 1871, deeply dissatisfied with the manner in which Prussia had brought about the unification of Germany.

GERWIG, gër'vîk, ROBERT (1820-85). A German railroad engineer, born at Karlsruhe and educated at the Polytechnic Institute in that city. In 1866 he projected the railroad through the Black Forest, and completed that difficult piece of engineering, with its numerous tunnels, in seven years. From 1872 to 1875 he had charge of the building of the Saint Gothard Railroad, which, together with Beckh, he had planned.

GERYON, jër'i-on, or **GERYONES**, jê-rî'ô-nêz (Lat., from Gk. Γηρυών). In Greek mythology, the son of Chrysaor and Callirhoë, a giant with three heads and three bodies, the ruler of the western island Erythia, where he kept a great herd of cattle. They were guarded by the herdsman Eurytion and by a monstrous two-headed dog Orthros, both of whom Hercules slew, together with Geryon himself, when he went to carry off the cattle as one of his twelve labors.

GESELLSCHAFT DER ÖSTERREICHISCHEN MUSIKFREUNDE, ge-zêl'shäft dêr ô'ster-rîk'îsh-en mû-zêk'froi'n'de (Ger., Society of Austrian Friends of Music). One of the oldest orchestral organizations in Europe. It was the direct outcome of a festival concert given in Vienna on November 29, 1812, in aid of the sufferers from the war with France. The work performed was Handel's *Timotheus*, which was received so favorably that the performance was repeated December 3d. Then Sonnleithner issued a circular urging all persons interested in music to form a society for the performance of larger works. Many lovers of the art responded, so that in 1814 the statutes of the new society were approved by the Emperor Francis I. At the head of this organization was a 'Protector,' who was always a nobleman. The first protector was Beethoven's pupil, the Archduke Rudolf. In 1835 the office of protector was abolished, and a president elected, who for many years was also a nobleman. But in 1867 artistic considerations led to the election of the citizen Dr. F. Egger. For the first five years the programmes consisted of oratorios; then mixed programmes were substituted, and even choral works were not excluded. All members were on an equal footing. The conductor was chosen by lot from among the members, many of whom were amateurs. Symphonies were performed in a curious and inartistic manner, Italian arias being interspersed between the different movements until as late as 1846. Not before 1824 was a symphony (the *Eroica*) performed consecutively and in its entirety. After 1840 the artistic standard of the society declined. Programmes were arranged with bad taste, the execution became careless, and new works and composers were ignored. The establishment of the Akademie der Tonkunst in 1851 led to a radical reform of the Gesellschaft, Hellmesberger

being then elected a conductor. This ambitious and energetic musician filled the places of amateurs by professional musicians, offered artistic programmes, and brought the orchestra to a high degree of technical efficiency. New composers now also found a ready hearing. This work was continued by the new conductor Herbeck, who was elected in 1859, and ever since its concerts have been among the musical events of Vienna. Among the conductors of the Gesellschaft have been Brahms and Richter.

GESELSCHAP, ge-zêl'shâp, EDUARD (1814-78). A German painter, born at Amsterdam. He was a pupil at the Academy of Düsseldorf, and at first his subjects were historical, but afterwards he became more successful as a genre painter. His works include: "Die Erscheinung des Christkinds" (1850); "Der Niklas—Abend" (1851); "Die Singschule" (in the Hanover Museum); "Der Weihnachtsmorgen" (in the Stockholm Museum); and "Musikalische Abendunterhaltung" (1865), Cologne Museum. In these pictures his lamplight and interior effects are cleverly executed.

GESELSCHAP, FRIEDRICH (1835-98). A German historical painter, born at Wesel. He studied at the Dresden Academy, then under Mintrop in Düsseldorf, and from 1866 to 1871 in Rome, where he gave his special attention to the monumental fresco paintings of Raphael and Michelangelo. In Berlin he became more widely known by his competitive designs for the decoration of the Kaiserhaus in Goslar (1877), and sprang into fame with his grand compositions of the mural paintings in the Ruhmeshalle (Hall of Fame) in Berlin, executed in 1882-90, and representing in numerous ideal figures: "A Roman Triumphal Progress;" "War;" "Peace;" "Walhalla;" and "The Reërection of the German Empire." In 1882 he was elected a member, and in 1884 Senator of the Berlin Academy, and received the title of professor. Consult Donop, *Friedrich Geselschap und seine Wandgemälde in der Ruhmeshalle* (Berlin, 1890).

GESENIUS, ge-zê'nê-us, WILHELM (1786-1842). One of the greatest German Orientalists and biblical scholars. He was born at Nordhausen, and educated at the gymnasium of his native town, and at Helmstedt and the University of Göttingen. After having been for a short time teacher in the pädagogium at Helmstedt, he became, in 1806, a theological *repetent*, or tutor, in Göttingen, and in 1809 was appointed professor in the gymnasium of Heiligenstadt. In 1810 he received a call to Halle as assistant professor of theology, and was made full professor in the following year. In 1820 and again in 1835 he traveled extensively, making investigations in various libraries. In 1827 he was called to Eichborn's position at Göttingen, but declined the call. In 1810-12 he published a *Hebrew and Chaldaic Dictionary of the Old Testament*. In 1813-14 appeared his *Hebräisches Elementarbuch*, consisting of a Hebrew grammar and a reading book, which were also published separately. This dictionary and grammar, as they have been successively revised and translated (13th ed. of the lexicon ed. by Buhl, 1899; 27th ed. of grammar ed. by Kautsch, 1902), are still standard books of reference, not only throughout Germany, but also in Great Britain and America. Of Gesenius's numerous other

writings, the following may be mentioned: *Kritische Geschichte der hebräischen Sprache und Schrift* (1815); *De Pentateuchi Samaritani Origine* (1815); a translation of the prophet Isaiah with commentary (1820-21); *Ausführliches grammatisch-kritisches Lehrgebäude der hebräischen Sprache* (1817); and *Scripturæ Linguæque Phœnicæ Monumenta* (3 vols., 1837). His larger lexicon of the Hebrew language, *Thesaurus Philologus Criticus Linguae Hebrææ et Chaldææ Veteris Testamenti*, which would undoubtedly have been his greatest achievement, but which was interrupted by his death, was completed in 1858 by E. Rödiger. Gesenius's great merit was his placing the study of Semitic languages on a sound philological basis. His method of interpreting the Old Testament was rationalistic. Both Semitic philology and biblical exegesis have advanced far beyond the point to which he carried them; nevertheless, his methods and principles underlie much of the work that has been done since his time, and that is still being done. Consult Hayne, *Gesenius, eine Erinnerung für seine Freunde* (Berlin, 1842).

GESHUR, gē'shūr. (1) An Aramean State, east of the Jordan, probably in the southern part of modern Jaulan. Its northern neighbor was Maacah. According to I. Chron. ii. 23, the latter took certain villages belonging to the Israelitish clan of Jair in Bashan. In Deut. iii. 14, Joshua xii. 5, Geshur and Maacah are said to border on the territory of Og of Bashan. It is not impossible that Ishbaal, the son of Saul (c. 1033-1026 B.C.), held possession of Geshur (II. Sam. ii. 9, Pesh., Vulg.), though it was subsequently independent. Many scholars hold that it was of this Geshur that Talmi, David's contemporary, was king. (2) In Joshua xiii. 2, and I. Sam. xxvii. 8, a Geshur is mentioned, but it seems to have been situated in Southwest Palestine. This Geshur was attacked by David from Ziklag. As Talmi also occurs as the name of a Hebronite giant (Judges i. 10), and Maacah as the name of a concubine of Caleb (I. Chron. ii. 48), it is possible that King Talmi of Geshur (II. Sam. iii. 3), whose daughter Maacah became David's wife and Absalom's mother, may have belonged to this southern clan.

GESNER, gēs'nēr, ABRAHAM (1797-1864). An American geologist, born in Nova Scotia. He studied medicine in London, and took his degree in 1827. Eleven years later he became geologist of the Province of Nova Scotia. In 1846 he made experiments on burning oil distilled from petroleum and on asphalt from Trinidad. Subsequently he discovered kerosene oil, and introduced its use in the United States. He traveled much in this country, and settled in New York City in 1852, but died at Halifax, N. S. His writings are: *Treatise on Coal, Petroleum, and Other Distilled Oils* (1860); *Remarks on the Geology and Mineralogy of Nova Scotia*; and *Geology of New Brunswick and Prince Edward's Island*; articles on "The Gypsum of Nova Scotia" (vol. v.), "Elevations and Depressions of the Earth in North America" (vol. xvii.), and "Petroleum Springs in North America" (vol. xviii.), in the *Journal of the London Geological Society*; and, in its *Proceedings*, a "Geological Map of Nova Scotia" (vol. iv.).

GESNER, JOHANN MATTHIAS (1691-1761). A distinguished German classical scholar. He

studied at the University of Jena, and in 1714 published a work on the *Philopatris*, ascribed to Lucian. In 1715 he became librarian and associate rector at Weimar; in 1729, rector of the gymnasium at Ansbach; and in 1730, rector of the Saint Thomas School at Leipzig, where he was associated with Johann A. Ernesti and Johann Sebastian Bach. On the foundation of the University of Göttingen he became professor of rhetoric, and subsequently librarian also. He did much to bring about a revival of the study of Greek in Germany, and used his influence to induce the German universities to base their instructions in Greek and Latin on the classical authors. He published editions of Quintilian (1738), Pliny the Younger (1739); Claudian (1759), and the *Scriptores Rei Rusticæ* (1735); but his greatest work is the *Novus Linguæ et Eruditionis Romanæ Thesaurus* (1749). Consult Ernesti, *Narratio de Gesnero* (Leyden, 1762).

GESNER, KONRAD VON (1516-65). A Swiss naturalist, born at Zurich. He studied Greek, Latin, Hebrew, and medicine at Zurich, Strassburg, Bourges, Paris, Montpellier, and Basel, at the last place taking his medical degree. He returned in 1541 to Zurich as professor of physics, and practiced in that city as physician until his death from the plague. Gesner collected and described animals and plants with the greatest zeal throughout his entire life, and wrote voluminously on many subjects. His most important work is *Historia Animalium* (1551-58), in which he intended to describe every known animal. The first book treats of viviparous, the second of oviparous quadrupeds, the third of birds, and the fourth of aquatic animals. The fifth book, on serpents, and the sixth, on insects, he left incomplete. He was preparing a description of all known plants at the time of his death. Gesner was the most important naturalist of his age. He performed the useful work of bringing together all that was known of animals and plants, including those of the recently discovered countries in the New and the Old World, and although he made no attempt to arrange them in a natural system, his work, together with the similar work of Aldrovandi (q.v.), formed the basis for the fruitful investigations and generalizations of the two following centuries.

GESNERACEÆ, gēs'nēr-ā'sē-ē (Neo-Lat. nom. pl., named in honor of Konrad von Gesner). A family of dicotyledonous plants, mostly herbs or shrubs, comprising about 70 genera and 700 species, natives of warm countries, distinguished from the Scrophulariaceæ by the parietal placenta of the ovary. Some authors divide the family into two tribes: Gesneraceæ with an inferior ovary and Cyrtandraceæ with a superior ovary. The chief genera of the former are Niphæa, Achimenes, and Rhytidophyllum; of the latter, which comprises a majority of the species, Calumnea, Eschynanthus, Besleria, Didymocarpus.

GESSI, jēs'sē, ROMOLO (1829-81). An Italian explorer, born at Ravenna. After serving in the Austrian Army, he was sent as an officer in the service of Egypt to the Sudan, where Gordon employed him to explore the Upper Nile and the Albert Nyanza (1876). Accompanied by Matteucci, he tried to enter the country of the Gallas, but without success. In 1880 he put down the insurrection raised by Suleiman Pasha in South-

ern Darfur, and became Governor of the Province of Bahr-el-Ghazal. He died at Suez, of malarial fever, May 1, 1881, and left a volume descriptive of his adventures, *Sette anni nel Sudan egiziano* (1891).

GESSELER, gēs'lēr. An Austrian official in the forest cantons of Switzerland, according to traditions connected with William Tell (q.v.). His oppressive edicts and wanton cruelty so enraged the inhabitants that a conspiracy was formed against him, and he was shot by Tell in a narrow pass near Küssnacht. He is a wholly legendary character.

GESSENER, gēs'nēr, LUDWIG (1828-90). A German jurist. He was born at Axthausen, and was educated at Halle, Heidelberg, and Berlin. He held important positions in the German Ministries of War, State, and Foreign Affairs, and wrote a number of valuable contributions to marine and international law, including: *Das Recht des neutralen Seehandels* (1855); *Le droit des neutres sur mer* (2d ed. 1876); *Zur Reform des Kriegs-Seerechts* (1875); "Die Staatsverträge im allgemeinen." in Holtzendorff's *Handbuch des Völkerrechts* (1887).

GESSENER, SALOMON (1730-88). A Swiss poet, painter, and etcher, very popular in his day as a writer and representative of the idyllic taste of his generation. He was born in Zurich, April 1, 1730. His first noteworthy piece, *Lied eines Schweizers an sein bewaffnetes Mädchen* (1751), was followed by *Daphnis* (1754), *Idyllen* (1756), and, most famous of all, *Der Tod Abels* (1758), which he called "a sort of idyllic prose pastoral." Gessner's work is throughout insipidly sweet and monotonously melodious; yet it exactly suited the taste of a generation nursed on Rousseau. The idylls had a European influence, and appeared in seven languages. He died in Zurich, March 2, 1788. Gessner's *Works* were frequently published, last in 1841. There is a French translation in three volumes (1786-93). Gessner's *Life*, by Höttinger, appeared in 1796; his *Correspondence with His Son* in 1801. For Gessner's literary influence, consult *Texte, J. J. Rousseau and Literary Cosmopolitanism* (New York, 1897).

GESTA ROMANORUM, jēs'tā rō'mā-nō'rūm (Lat., the deeds of the Romans). The title of one of the most popular collections of anecdotes in the later Middle Ages. The stories are written in Latin, and supposedly are based on Roman history, though in fact there is very little actual history contained in them. Probably at an early date there were collections of stories taken from Roman history, and used as texts for sermons. These stories were then put together for the express purpose of being moralized, and finally appeared under the title of *Gesta Romanorum Moralizata*, or something similar. No manuscripts have come down, and the three earliest editions we have were printed between 1472 and 1475, and contained altogether 181 stories, which had originated, according to Oesterley, in England at the end of the thirteenth century. The stories are short and destitute of rhetorical ornaments, and have neither dialogue nor tragic incident. Their attractiveness lies in their child-like simplicity. The stories were very widely read, and were translated into many languages. Shakespeare's *King Lear* is based upon one of the tales in the *Gesta Romanorum*, and a part

of the *Merchant of Venice* comes from the same source. Schiller's *Der Gang zum Eisenhammer* is also one of the stories of this collection. Furthermore, Chaucer, Gower, and others owed considerable to these simple stories. The best critical edition is that of Oesterley, *Gesta Romanorum* (Berlin, 1872). A good English version with an introduction has been edited by Hooper, *Gesta Romanorum* (London, 1894).

GESTATION (Lat. *gestatio*, from *gestare*, frequentative of *gerere*, to carry). The term applied in physiology to the period that intervenes in the mammalia between impregnation and the bringing forth of the young. The length of gestation and the number of young produced at a birth vary extremely in different mammals, but usually stand in an inverse ratio to one another. Thus, in the larger Herbivora, as, for example, the elephant, the horse, the ox, and the camel, the female seldom produces more than one at a time, but the period of gestation is long; while in the smaller ones the progeny is numerous, but the period of gestation is only a few weeks. In the elephant the period of gestation extends over 21 or 22 months; in the giraffe it is 14 months; in the dromedary it is 12 months; in the mare upward of 11 months; in the tapir, between 10 and 11; in the cow, 9; and in many of the larger deer, somewhat more than 8 months. In the sheep and goat the period is 5 months. In the sow, which produces a numerous litter, the period is 4 months. In the Rodentia the progeny is numerous and imperfectly developed, and the period of gestation is comparatively short; in the beaver, one of the largest of the order, it is 4 months; in the rabbit and hare, from 30 to 40 days; in the dormouse, 31 days; in the squirrel and rat, 4 weeks; and in the guinea-pig, 3 weeks or less. The young of the Carnivora, like the young of the Rodentia, are born with their eyes closed, and in a very immature condition; and even in the larger Carnivora the period of gestation is far shorter than in the larger Ruminantia or Pachydermata; it is 6 months in the bear; 108 days in the lion (the period in this animal is stated by Van der Hoeven at 3 months); 79 days in the puma; 62 to 63 days in the dog, the wolf, and the fox; and 55 or 56 days in the cat. Of the Marsupialia, gestation in the kangaroo lasts 39 days, in the opossum 26 days. Of the Quadrumana, the period of gestation lasts 7 months in the monkey, which bears one, rarely two, young at term. Of the Cetacea, the whale's normal pregnancy lasts 10 months. Domesticated animals breed oftener than those in a wild condition. Wild pigeons breed twice, domesticated pigeons six or more times a year.

In woman, the accepted period of gestation is 275 days from insemination, or 280 days (on an average) from the last day of the previous menstruation. In a young mother, the first pregnancy may be much shorter than succeeding pregnancies. Prolongation of gestation to 300 days is possible, counting from the last menstrual flow. French law admits the legitimacy of a child born 300 days after the separation of the parents; Scotch law allows 10 months; English law allows the lapse of 11 months between the death or departure of the husband and the birth of a legitimate child; in the United States it was decided, in the case of the *Commonwealth vs. Porter*, that a child born 317 days after the absence of the father began was not a bastard.

GESTE, zhâst, CHANSONS DE. See CHANSONS DE GESTE.

GESTURE (ML. *gestura*, from Lat. *gerere*, to carry, to conduct). An expressive movement (see **EXPRESSION**) which is intended to convey some thought or emotion in visible form. Psychologically considered, gesture evinces two ultimate forms—the demonstrative and the imitative. Demonstrative gestures are capable of but little development, though their range has extended from the indication of present objects to that of dimensions in space and time, and of the organs and functions of the body. The imitative gestures, on the other hand, have undergone a long series of developmental changes. We have, first, the imitative gestures proper, or pictorial signs, in which, e.g. a house is indicated by the finger outline of walls and gable roof, and a room by an outlined square. Next in order stand the characterizing gestures, in which some feature or aspect of the object is made to do duty for the whole—a deaf-mute sign for 'man' is the movement of taking off the hat. Lastly, we find symbolic gestures, from which the element of direct imitation has altogether disappeared. These show all stages of refinement, from the sticking up of the forefingers above the ears to indicate stupidity (ass's ears), to the outward movement of the spread hand, that signifies 'be quiet,' or the crossing of the forefingers, by which the American Indian makes known his readiness to trade. Consult: Wundt, *Völkerpsychologie* (Leipzig, 1900); Tylor, *Early History of Mankind* (London, 1878).

GESTURE LANGUAGE. The communication of thought by bodily movements, excepting the use of the vocal organs in speech or exclamations. They are not confined to man alone, but are possessed by many other animals to a greater or less degree, and thus, together with exclamations which also occur to some degree among animals, gesture language is one of the most primitive modes of transferring ideas. That gesture is to some extent produced by speech deficiency is clear from the fact that individuals of mutually unintelligible vernaculars are obliged, in the absence of an interpreter, to communicate at first entirely by gestures, and that as their speech becomes intelligible the necessity for gestures steadily diminishes to a certain point. A certain amount of gesture language is imperative in connection with spoken language, and its refined employment is a mark of culture.

The gestures used as a form of language may best be divided into manifestive, demonstrative, and imitative. To this classification symbolic and comitative gestures are added by some scholars. Comitative gestures are but a subclass of the imitative, while symbolic gestures seem to be another subdivision of the imitative signs, and it is important to observe that in many instances the imitative gestures themselves may be derived ultimately from the manifestive group. The simplest class of gesture language is formed by the manifestive class, which is in the main emotive in character. Here belong such gestures as striking the breast, or pressing the head tightly between the hands in grief (apparently a sort of physical counter-irritant to mental pain); turning up of the nose in contempt (originally an expression of disgust at a foul odor); the backward thrust of the upraised hands with the palms

outward, to repel anything disagreeable or dangerous; the shrug of the shoulders to denote indifference or despair (primarily to express muscular adjustment to meet something which is inevitable); stamping the foot in rage (found also among animals, notably in an enraged bull; perhaps originally, as in the case of an angry lion lashing himself with his tail, an exciting stimulus of fury already aroused); and many others. The demonstrative gestures differ from the manifestive in being altruistic instead of egoistic—that is, they refer to others, and not to self. To this class belong such motions as the simple pointing gesture; the laying of the finger on one's own lips to enjoin silence in others; the light tapping of one's own forehead with the finger-tip to indicate that another person is deranged; the Neapolitan gesture to mark present time, in which the outstretched finger is pointed downward, or to show past time by directing the right thumb a little backward over the shoulder. In this class the gestures intended to apply to others are often really indicated on one's self from motives of decorum and the like. Certain demonstrative gestures seem to be modified manifestive signs, as the pointing with the finger. This gesture is probably originally of the same manifestive type as the pricking up of the ears of a horse, who sees something which excites his attention, while the transition from the one type to the other may be seen in the pointing of a setter who flushes birds for the hunter, even though this latter gesture is an artificial one. The most important class, although the last in order of development, is the imitative type. Thus, to express the idea of weariness, the Neapolitan wipes his forehead with his thumb, to indicate the removal of sweat; or to indicate that one is a flatterer, the gesturer kisses his own finger-tips. Again, in America as well as in Italy, the idea of cutting the throat is expressed by drawing the inner edge of the hand across the throat; and the American Indian indicates that a man is a liar by placing his hand to his lips and distending two fingers, in imitation of the forked tongue of a snake. To show that one is servile, a cringing attitude may be assumed, while shaking the clenched fist in rage is obviously imitative of the blow given in fight. Certain gestures are involuntary in origin, especially the blush.

A sharp distinction must be drawn between natural and artificial gesture language. From the primitive natural gestures there are developed by imitation, teaching, and convention, numerous artificial gestures, which are occasionally of such complexity that their exact origin may be a matter of doubt. As a single instance may be cited the custom of shaking hands to express friendship. This seems to have originally indicated mutual safety, from the fact that the right hands, which alone could hold the sword, were necessarily empty of weapons. Artificial gesture language may be or become altogether conventional or arbitrary in character. Of this type the deaf-mute alphabet is a familiar example. It is obvious, in the light of what has been said, that the gesture language, like oral language, is divisible into dialects. A sign which indicates one thing in a given gesture dialect may indicate a different thing in another dialect, although dialectic differences are very few in comparison with spoken language. The influence of

speech has operated most strongly on gesture language, which is indeed of very limited scope without the aid of speech. Pure gesture language is practically confined to persons or things present before the person using the signs at the instant when he is employing them. Tense and pronoun are unknown, and it seems safe to affirm that gestures correspond not to words, but to sentences in speech. Syntax, therefore, despite the arguments of certain authorities, seems lacking in this form of communication. Gesture language, like primitive interjections, which also are shared by man with other animals, is thus primarily a reflex emotive expression, originally purposeless in character, but gradually developed on account of the necessity of conveying thought, either without or in addition to speech, which is felt by all mankind.

The forms of gesture language which are the most important for the student of language are those employed by deaf mutes, the American Indians, the Neapolitans, and the Cistercian monks, represented in the United States by the Trappist Order, who have taken the vow of perpetual silence. See also EXPRESSION; GESTURE.

GETA, jě'tá, SEPTIMIUS (A.D. 180-212). A son of Septimius Severus, and brother and colleague of Caracalla. Upon his father's death he was proclaimed Emperor, with Caracalla, but in the following year was murdered by centurions at the instigation of his brother.

GETÆ, jě'tě (Lat., from Gk. *Γέται*, *Getai*). An ancient warlike people, who figure in the wars of the Greeks and Romans. At the dawn of history they inhabited the country which is now called Bulgaria. Here Darius encountered them in his Scythian expedition. Shortly before the time of Alexander the Great, who warred with them, the bulk of the nation had migrated northward across the Danube. They spread over a wide region, extending from the Black Sea to the plains of Hungary. The Getæ south of the Danube, in Mæsia, were united in a powerful realm in the time of Cæsar, but this State had only an ephemeral duration, the Roman power becoming supreme in these regions. The Getæ, as an independent people, disappear from history about the close of the first century A.D. At the time of the great migration of nations they appear to have been absorbed by the Goths, with whom they came to be erroneously identified. The Getæ are often mentioned in the literature of the Augustan era as savage and unconquerable foes.

GETHESEMANE, gěth-sēm'á-ně (Aramaic, from *gath*, a wine-press + *shemen*, oil). A small farm or estate on the Mount of Olives, about three-quarters of a mile from Jerusalem, and separated from it by the Kedron Valley. Attached to it was a garden, or orchard, a favorite resort of Christ and His disciples (Luke xxii. 39; John xviii. 1, 2), and the scene of the

agony on the night before Christ's passion (Matt. xxvi. 36-47; Mark xiv. 26-42; Luke xxii. 39-46). The spot pointed out to modern travelers as the site of Gethsemane is admitted to be near the real location, although some think it too near Jerusalem to be Gethsemane itself. It is a place about 150 by 140 feet, inclosed by a stone wall, and contains eight very old olive-trees, which are popularly supposed to have existed in the time of Christ, though they cannot be traced farther back than the sixteenth century. Consult: Conder, *Bible Places* (London, 1897); Thomson, *The Land and the Book*, vol. ii. (New York, 1880-81).

GETTY, gět'ti, GEORGE WASHINGTON (1819-1901). An American soldier, born in Georgetown, D. C. Upon graduation at the United States Military Academy in 1840 he was commissioned second lieutenant in the Fourth Artillery. He served on the frontier during the Canadian border troubles, and, with rank of brevet captain, fought in the Mexican War at Churubusco, Molino del Rey, Chapultepec, and the City of Mexico. In the Civil War he served with the Army of the Potomac in the Virginia Peninsular campaign, and from the siege of Petersburg to the Confederate surrender at Appomattox. He fought also in the Richmond campaign of 1864, and rose to the rank of brevet major-general, United States Army. In 1866 he became colonel of the Thirty-seventh Infantry, in 1882 was transferred to the Fourth Artillery, and in 1883 was placed upon the retired list.

GETTYSBURG, gět'tiz-bürg. A borough and the county-seat of Adams County, Pa., 35 miles southwest of Harrisburg; on the Western Maryland and the Philadelphia and Reading railroads (Map: Pennsylvania, D 4). It is situated among picturesque hills in a fertile agricultural country, and is the seat of a Lutheran theological seminary, founded in 1826, and of Pennsylvania College (Lutheran), organized in 1832. The industrial establishments comprise shirt, furniture, knife, and stocking factories, planing-mills, and a foundry. The borough is governed under a charter of 1853, which provides for a burgess, elected every three years, and a unicameral council. Population, in 1890, 3221; in 1900, 3495. Laid out in 1780, Gettysburg (named after Gen. James Gettys, its founder), was made the county-seat in 1800, and was incorporated as a borough in 1806. One of the most noted battles of the Civil War was fought here, July 1-3, 1863, a Federal army under General Meade defeating the Confederates under General Lee. (See GETTYSBURG, BATTLE OF.) The entire battlefield has been included in a national park, the sites of particular actions being marked by monuments, of which there are now over four hundred. On Cemetery Hill stands the National Cemetery, 17 acres in area, dedicated by President Lincoln on November 19, 1863. In it there are 3629 graves, 1630 of unknown dead. From the brow of the hill rises a battle monument surmounted by a statue of Liberty, and with typical basal figures of War, Peace, History, and Plenty.

GETTYSBURG, BATTLE OF. The most important and most hotly contested battle of the Civil War in America, fought July 1-3, 1863, at Gettysburg, Pa., between the Federal Army of the Potomac, numbering about 82,000 men, under General Meade, and the Confederate Army of

Northern Virginia, numbering about 73,000 men, under General Lee. After the battle of Chancellorsville (May 2-4) the two armies stood for some weeks facing each other across the Rappahannock at Fredericksburg, Va., General Lee taking advantage of the interval to reorganize his army and divide it into three corps, each of three divisions, which he placed under Longstreet, Ewell, and A. P. Hill respectively. This accomplished, and his army being sufficiently rested, he decided upon the invasion of Pennsylvania, hoping by this bold plan to draw Hooker, then commanding the Army of the Potomac, in pursuit, to defeat the Federal Army on Northern soil, to threaten and perhaps capture Washington, to secure the support or at least recognition of France and England, and to bring the war to a close, forcing from the North a recognition of the independence of the Confederacy. On June 3d he began to move, and by June 26th each of the three corps had crossed the Potomac into western Maryland, Ewell having passed over about ten days earlier and having entered Pennsylvania, where he threatened Harrisburg. Hooker followed along the east bank of the Rappahannock about the middle of June, and on the 25th and 26th crossed the Potomac at Edwards Ferry. On the 28th he was superseded as commander of the Army of the Potomac by General Meade, who soon selected a field of battle along Pipe Creek, on which, if possible, to concentrate his forces and meet the Confederate Army. On the afternoon of June 30th, however, Buford, with a force of Federal cavalry, occupied McPherson's Ridge, beyond Seminary Ridge, west of Gettysburg, and here, at about eight o'clock on the following morning, he came in contact with Heth's division of Hill's Confederate corps, the whole Confederate Army having been ordered by General Lee to concentrate at Gettysburg. Though considerably outnumbered, he stubbornly held his ground for two hours, until the arrival of General Reynolds at the head of the First Corps of the Federal Army, which was reinforced about 1 p.m. by the Eleventh Corps under General Howard, the Federal troops now occupying ground north as well as west of Gettysburg. At about one o'clock, also, General Ewell arrived with a part of his corps, the rest coming up during the afternoon, and took command on the Confederate side. At about 4 p.m. the Confederates advanced for what proved to be their final attack, drove the Federals from the field, and occupied the ground thus vacated. The Federals, under Hancock, who had superseded Howard by Meade's orders about 3.30 p.m., took up a strong position on Cemetery Ridge and Culp's Hill (south and southeast of Gettysburg), which they quickly fortified. Both sides had suffered heavily during the day in killed and wounded, and the Confederates took several thousand prisoners. The Federals sustained their severest loss in the death of General Reynolds, who was killed instantly by a Confederate sharpshooter late in the morning. Thereafter until the arrival of General Howard, General Doubleday had been in command. During the night and the following day almost the whole of each army was brought upon the field, though Pickett's division of Longstreet's corps did not arrive until toward night on the 2d. The Federal position formed a long convex line, beginning at Culp's Hill and ending at Round Top, General Sickles, with the Third Corps, occupying ground

somewhat in advance and to the north of Little Round Top, his line following roughly the angle formed by the junction of the Emmitsburg Road and the crossroad leading therefrom to the Taneytown Road, east of the Federal position, and being 'refused' toward Devil's Den. At the crossing there was a peach orchard, and between the crossing and the ridge along which the Federals were intrenched there was a wood north of the road and a wheat-field south of it. The Confederate position, on the other hand, formed a much longer and thinner concave line, with Longstreet in command on the right, A. P. Hill in the centre, and Ewell on the left. Lee, against the emphatic advice of Longstreet, who wished to manœuvre the Federals out of their position and interpose the Confederate Army between Meade and Washington, resolved to attack, and issued orders, accordingly, to Longstreet on the right and Ewell on the left, the former being expected to make the principal assault. The operations on the right did not begin until about 4 p.m. on July 2d, though, according to many Southern writers, Longstreet should have delivered his attack early in the morning, when there would have been a much greater chance of Confederate success. When made, however, the attack was vigorous and spirited, and, after a fierce conflict, the angle at the peach orchard was broken in, and the Federals were forced to abandon their advanced position and fall back upon their main line, along Cemetery Ridge. The Confederates, however, were unable to carry Round Top and Little Round Top, the points of greatest strategic value on the Federal left. During the engagement Sickles was wounded and General Meade added the Third Corps to the command of General Hancock. In the defense of Little Round Top, which Warren had caused to be occupied in time to repel the Confederate attack, two able Federal generals, Weed and Hazlett, were killed, and another, Vincent, was mortally wounded. On each side the losses were exceedingly heavy. Late in the afternoon, after an artillery duel lasting about an hour, Early and Johnson, both of Ewell's corps, led their divisions against the Federal right, Early assaulting Cemetery Hill and Johnson Culp's Hill. Early, with whom Rodes, commanding the other division of Ewell's corps, failed properly to cooperate, attacked with great vigor, and succeeded in breaking a line of infantry on the slopes and overrunning Wiedrich's Eleventh Corps and Rickett's reserve batteries; but was finally driven back, the Federals at this point thus preserving the integrity of their line. Meanwhile Johnson had met with more success at Culp's Hill, whose defenders had been greatly reduced in number in order to reinforce Sickles on the Federal left, and gained a substantial foothold, which he held over night, but from which he was driven before noon on the following day.

On the night of the 2d Meade held a council of war, in which it was decided to hold the Federal Army in the position then occupied and await further attack. On the morning of the 3d Lee ordered Longstreet to send Pickett forward to assault the Federal centre as soon as the Confederate artillery should have silenced or noticeably weakened the artillery on the other side. At 1 p.m. began a terrific artillery duel, the Confederates concentrating most of their fire from about one hundred and fifty guns on Ceme-

tery Ridge, and the Federals answering with about seventy guns, under the direction of Gen. Henry J. Hunt, chief of artillery in the Army of the Potomac. After about an hour and a half, the Federal artillery, though not seriously damaged, ceased firing to save ammunition and prepare for the Confederate attack. This silence being misconstrued by the Confederate officers, Pickett's division, numbering altogether about 5000, moved forward, supported on the right by Wilcox, with about 5000 men, and on the left by Pettigrew, also with about 5000, to attack the Federal centre on Cemetery Ridge, under the immediate command of General Hancock. The charge was one of the most magnificent known in military history. Advancing steadily in three columns, in face of a destructive artillery fire, the Confederates promptly filled up the great gaps cut into their lines by the Federal shells, and encountered unflinchingly, after they had passed beyond the Emmitsburg Road, a terrific fire of canister and an enfilading cannonade from a battery on Little Round Top. When within about three hundred yards of the Federal line they met the musketry fire of the Federal infantry, which had been previously withheld. Pettigrew's advance was utterly demoralized, while Wilcox dropped behind, veering, somewhat bewildered, to the right. Pickett's men, nevertheless, pressed on, and in a hand-to-hand conflict carried the first Federal line, but were soon driven back, and were finally forced in rapid retreat, their ranks being enveloped by pursuing Federals, back to the Confederate lines. As many as two-thirds of Pickett's immediate command, according to some writers, were killed, wounded, or captured. Of his three brigade commanders, Garnett was instantly killed; Armistead, who had penetrated farthest, was mortally wounded; and Kemper was severely injured. On the Federal side, General Hancock was badly wounded and many able officers were killed. Meanwhile, on the Federal right, Gregg defeated the Confederate General Stuart in a spirited cavalry engagement, and on the Federal left, General Farnsworth was killed, while making a cavalry charge, under General Kilpatrick's orders, against Longstreet's advanced skirmishers. Both armies rested during the 4th, but on the ensuing night, under cover of the darkness and a heavy rain, Lee began his retreat toward the Potomac, which he crossed on the night of the 13th, without having been attacked by the pursuing Federal Army. During the three days' battle the Federal Army lost 3072 killed, 14,497 wounded, and 5434 captured or missing; the Confederate Army, according to official reports, which, however, have been called in question, 2592 killed, 12,709 wounded, and 5150 captured or missing. The battle has been regarded as the turning-point of the Civil War.

GEULINCKX, hē'lings, *Fr. pron.* zhē'lānks', **ARNOLD** (1625-69). A Dutch philosopher. He was born at Antwerp, studied theology and philosophy at Louvain, and afterwards remained twelve years as a successful lecturer and teacher of the classics and the Cartesian philosophy. For some reason not certainly known, but supposed to have had connection with his intended marriage, and his attacks upon scholasticism, he was compelled in 1658 to leave Louvain and went to Leyden, where he became a Protestant, was married, endured many hardships due to poverty, and in 1665 was helped by an influential friend to the position of extraordinary professor in the university. Entering into this work with great zeal, he continued in it until his death. He was distinguished among the followers of Descartes, and his writings contain germs of thought that were afterwards developed by Spinoza and Malebranche. He gave special attention to the doctrine of the relation between the soul and the body. Descartes had already so separated extension and thought that only in the teeth of logic could he maintain against Gassendi the possibility of any interaction between them. Geulinx was more consistent. Accepting from Descartes this separation, he maintained that interaction was impossible, for one cannot be the author of any state of which one is unconscious: for man's very nature is consciousness; but a man is not conscious of the mechanism by which bodily motion is produced, hence he is not the author of bodily motion. Body and mind are like two clocks which act together, because at each instant they are adjusted by God. A physical occurrence is but the occasion on which God excites in the soul a corresponding mental state. Geulinx thus originated the theory of occasional causes. (See OCCASIONALISM.) But this theory compelled a further advance. God, who is the cause of the union of body and mind, is the sole cause in the universe. No fact contains in itself the ground of any other. The existence of the facts due to God, their sequence, and coexistence are also due to Him. He is the ground of all that is. Apart from God the finite being has no reality. In this Geulinx led the way for Spinoza. This occasionalistic view, carried out consistently, of course leads to the doctrine that we cannot know extended reality directly, but have merely an idea of it, occasioned in us by God. Geulinx's main works were: *De Virtute et Primis ejus Proprietatibus* (1665; ten years later a new and enlarged edition appeared under the title *Tractatus de Virtute*); *Logica* (1662); *Methodus Inveniendi Argumenta* (1663); *Metaphysica Vera et ad Mentem Peripateticam* (1691). A complete edition of his works in three volumes has recently been published by Land (The Hague, 1891-93). Consult: Grimm, *Arnold Geulinx' Erkenntnistheorie und Occasionalismus* (Jena,

1875); Land, *Arnold Geulincx und seine Philosophie* (The Hague, 1895); Pfeleiderer, *Arnold Geulincx als Hauptvertreter der occasionalistischen Metaphysik und Ethik* (Tübingen, 1882); Van de Haeghen, *Geulincx: Etude sur sa vie, sa philosophie et ses ouvrages* (Ghent, 1886).

GE'UM (Lat., herb-bennet, avens). A genus of plants of the order Rosaceae. It is nearly allied to *Potentilla*, but is distinguished by the hardened, hooked eyes which crown the carpels, and which are dry and become a bur. Two species are common natives of Great Britain, common avens or herb-bennet (*Geum urbanum*), an herb about one to two feet high, and water-avens (*Geum rivale*), about one foot high. Both of these species have the radical leaves interruptedly pinnate and lyrate, and the cauline leaves ternate, but *Geum urbanum* has erect yellow flowers, and *Geum rivale* has nodding flowers of a brownish hue. The former grows in hedges and thickets, the latter in wet meadows and woods, and sometimes even in alpine situations. Both are aromatic, tonic, and astringent, and are employed to restrain mucous discharges, and in cases of dysentery and intermittent fever. The root of *Geum rivale* is used also in diseases of the bladder. The root of *Geum urbanum* has when fresh a clove-like taste, and is used to flavor ale; for this purpose it is gathered in spring before the stem grows up. *Geum rivale* is a common plant in the United States as far west as Missouri. The chocolate-root (*Geum strictum*) of North America has some reputation as a mild tonic. It was once employed in the United States in diseases of the bladder. It much resembles the British species in its leaves and has erect flowers like those of *Geum urbanum*. Many of the species are very hardy, and are used in borders and other ornamental plantings. One group has plumose styles that are very attractive after the petals have fallen. *Geum Chilense*, a native of Chile, is one of the best of this class. Other species are particularly adapted to rockeries. The genus is mainly represented in the cooler regions of the two hemispheres.

GEVAERT, *ge-värt'*, FRANÇOIS AUGUSTE (1828—). A Belgian composer and writer on music, born at Huyse. When thirteen years old he was sent to the Ghent Conservatory, and soon after became organist of the Jesuits' Church at Ghent. In 1847 he won first prize for composition at the Brussels National Competition, and two years later visited France, Spain, and Italy, a trip made possible for him by his success in the above competition. In 1852 he returned to Ghent, where he lived for a number of years as a composer. In 1867 he was appointed 'chef de chant' at the Académie de Musique, Paris; in 1871, succeeded Fétis as director of the Brussels Conservatory; and in 1873 was elected a member of the Académie des Beaux-Arts. He composed a number of successful operas, among them *Le capitaine Henriot* (1864), *Le diable au moulin* (1859), and *La comédie à la ville* (1848), as well as cantatas and songs, but is best known for his works on music. *Traité d'instrumentation* (1863; German trans. by Riemann, 1887) is a standard work, and one of the few thorough treatises on that subject. His other writings include: *Les origines du chant liturgique de l'église latine* (1890, German trans. by Riemann); *Les*

gloires de l'Italie (1868); and *Chansons du XVème siècle* (1875).

GEVELSBERG, *gä'vels-bèrk*. A town in the Prussian Province of Westphalia, 28 miles east by north of Düsseldorf (Map: Germany, B 3). Its manufactures include iron and steel wares, hearths, gas stoves, and machinery. Population, in 1890, 9379; in 1900, 13,499.

GEWANDHAUS-CONCERTE, *ge-vánt'hous kón-tsér'te*. The name of a famous concert institute in Leipzig. The word *Gewandhaus* signifies a cloth merchants' hall, and these concerts were so called because, for want of a suitable hall, they were held in such a building. Their beginning dates back to 1743, when Doles began a series of subscription concerts which he continued until 1756, when they were interrupted by the Seven Years' War. J. A. Hiller revived the concerts in 1763 under the name of *Liebhaber-konzerte*. The orchestra, which originally consisted of but sixteen performers, was increased to thirty. In 1781 the burgomaster Karl Müller, together with eleven others, organized a board of directors, and opened subscriptions for a series of twenty-four concerts to be given every season. At present the orchestra consists of about seventy performers, and twenty regular subscription concerts are given. Besides these, two benefit concerts are arranged annually—one for the orchestra pension fund, the other for the poor. When, in 1835, Mendelssohn assumed the conductorship of the Gewandhaus concerts, they soon rose to such fame and importance that for a time Leipzig was the centre of music not only of Germany, but of all Europe. Among the eminent conductors have been Doles, J. A. Hiller, Mendelssohn, F. Hiller, Gade, Rietz, Reinecke, Nikisch.

GEYSER, *gi'zër* (Icel. *Geysir*, name of a famous hot spring in Iceland, from *geysa*, *gjösa*, to gush). An eruptive thermal spring. A true geyser has an underground passage communicating with a source of water-supply and usually terminating at the surface in a basin built up by a deposition of sinter. From the surface vent eruptions of hot water accompanied by subterranean rumblings take place at more or less regular intervals. In the powerful outbursts the water is shot upward with a loud roar to a height of 100 feet or more; this display continues for a brief time, and then subsides until the next period of activity. The occurrence of geysers is limited to regions of recent volcanic activity, where hot springs and mud springs are accompanying phenomena. The geysers of Iceland have been known for many centuries, while those of Yellowstone Park and of North Island, New Zealand, were discovered only in the last century. The most prominent examples in Iceland are the Great Geyser, the Little Geyser, and the Stokkr; the first has a pipe nearly ten feet in diameter, and erupts at intervals of a day or more, hurling the water like an immense fountain to a height exceeding 100 feet. In Yellowstone Park there are at least 70 eruptive geysers, and nearly 3000 vents of mud volcanoes, fumaroles, and hot springs, most of which occur in four basins. The surface is covered with terraces and elevations surrounding the openings, beautifully ornamented with snowy deposits of silica. Among the most remarkable of these geysers are the Giant, which

throws a column of water five feet in diameter to a height of 200 feet, playing continuously for an hour and a half; Old Faithful, which spouts with great regularity every sixty-five minutes, sending the water to a height of 125 feet; Castle Geyser, issuing from a chimney twelve feet high; Excelsior, which has a basin 200 feet in diameter, and spouts at intervals of eight years; the Giantess, which is said to throw a column twenty feet in diameter; the Beehive; and the Grand Geyser. The terraces of Rotomahana, New Zealand, once rivaling those of Yellowstone Park, were destroyed by a volcanic eruption in 1886.

The investigations of Bunsen in the geyser region of Iceland, confirmed as they were by laboratory experiment, have been generally accepted by geologists as affording a satisfactory

SECTION OF GEYSER.

explanation of the origin and activity of eruptive thermal springs. By seepage from the surface the geyser tube (a) is filled with a column of water, which, at a considerable depth, receives heat from buried lava flows or other volcanic sources. When the temperature in the lower part of the tube is raised to such a point that the water boils in spite of the superincumbent column, a portion of the water is changed into steam, and by expansion causes an overflow at the surface. Thus relieved of pressure, a large quantity of water flashes into steam, and ejects the whole column violently into the air. If the circulation of the waters be impeded by throwing stones into the geyser tube, the eruption can often be hastened. Geysers in many cases were originally hot springs, from which they have gradually developed by building and extending their tubes. Hot alkaline springs carry silica in solution, which is readily precipitated along the path of the flowing water; as the tube becomes longer, the difference in temperature between the upper and lower portions increases, until sufficient to cause an eruption. In course of time geysers must lose their activity, and again become hot springs, or the flow of water may be entirely checked by structural changes in the tubes. Consult: *United States Geological Survey of the Territories*, 5th and 6th Annual Reports (Washington, 1872-73); Bunsen, *On the Intimate Connection Existing Between the Pseudo-Volcanic Phenomena of Iceland* (London, 1848); Malfroy, *On Geyser Action at Rotorua* (1891).

GEYSERITE, g'zër-it. A name given to a variety of opal that occurs in concretionary deposits around the geysers of Iceland, New Zealand, and in the Yellowstone Park. It frequently occurs in white or grayish porous stalactitic or filamentous forms that are sometimes of great beauty. Varieties that are compact-massive or scaly-massive in appearance are sometimes found. The mineral consists essentially of silica, with from 9 to 13 per cent. of water.

GEYTER, g'ètër, JAN DE (1830—). A Flemish poet, born at Lede. His works are distinguished by a largeness of vision, and vigorous, expressive language. They include: *Drie menschen van de wieg tot in het graf. Een epos uit onzen tijd* (1861); *Geuzenlied* (1872); *Reinaart de vos*, a charming version of the old poem (1874); *Vlaanderens kunstroom* (1872); *De Wereld in. Schoolcantate* (1880); *De Rijn* (1882); and *Keizer Karel in het rijk der Nederlanden* (1888), an epic.

GFRÖRER, g'frërër, AUGUST FRIEDRICH (1803-61). A German historian. He was born at Calw in the Black Forest, and much against his own inclination was put to studying theology, and kept at it till the age of twenty-two. After traveling in Switzerland and Italy, he became tutor in theology at Tübingen in 1828, and in 1830 secured a position in the National Library at Stuttgart. His ability was very great, and his energy inexhaustible, and the works he now put forth received, and deserved, great attention. His whole life manifested a steady evolution from liberal Protestantism to Ultramontane Catholicism. During the writing of his *Philo und die jüdisch-alexandrinische Theosophie* (1831), and the *Geschichte des Urochristentums* (1838), his views on Christianity underwent a radical transformation. During the publication of *Gustav Adolf und seine Zeit*, he changed his point of view, and while at work on his *Allgemeine Kirchengeschichte* (1841-46), embracing the history of the Christian Church to 1305, he became convinced of the wrongfulness of the Reformation and the truth of the Catholic position. He was called to the Catholic University of Freiburg in 1846, showed himself an enemy of Prussia at the Frankfort Parliament, 1848-49, and became a vigorous champion of the Catholic faith, which he embraced in 1853. He died July 6, 1861. Besides the works already mentioned, he wrote: *Urgeschichte des menschlichen Geschlechts* (1855); *Papst Gregor VII. und sein Zeitalter* (1859-61); *Geschichte des 18. Jahrhunderts* (1862-74); *Zur Geschichte deutscher Volksrechte* (1866); *Byzantinische Geschichten* (1872-74). The last three works were published by Weiss after the death of the author.

GHADAMES. See GADAMES.

GHARA, g'rà'a. The name borne by the Sutlej, the easternmost of the five rivers of the Punjab, below its confluence with the Beas (Map: India, B 2). The Ghara unites with the Chenab, which has previously collected the waters of the Jhelum and the Ravi, to form the Panjnad, which carries the drainage of the Punjab into the Indus. See SUTLEJ.

GHARDAYA, g'är-di'a. See GARDAIA.

GHARIAL, or **GHARIYAL**. See GAVIAL.

GHATS, g'ats. The name (see GHATS below) applied to two converging ranges of mountains,

GEYSERS
CASTLE GEYSER AND CRYSTAL SPRING (UPPER)
NORRIS GEYSER BASIN (LOWER)

or scarpments, which run parallel with the east and west coasts of the peninsula of India, hence known as the *Eastern* and *Western Ghats*. The Eastern Ghats extend, with an average height of 1500 feet from the vicinity of Orissa to Coimbatore, along the eastern side of the Indian Peninsula, a distance of from 50 to 150 miles from the Bay of Bengal (Map: India, C 6). Before joining the kindred ridge at this last-mentioned point, they send forth, about 36 miles to the north of Madras, a spur common, as it were, to both ranges, and reaching the other range to the north of the gap of Palghatcheri. To the south of the departure of this connecting chain, the Eastern Ghats become less continuous and distinct.

The Western Ghats stretch from the south side of the Tapi to their junction with the kindred ridge, at a distance of 20 miles from Cape Comorin, or, in fact, to Cape Comorin itself (Map: India, B 5). Though they are generally far more continuous and distinct than the Eastern Ghats, yet they are sharply divided by the gap of Palghatcheri, 16 miles wide, the northern section measuring 800 miles in length, and the southern 200. Their general elevation appears to vary from about 3000 feet to fully 7000 feet. The peak of Dodabetta, in that portion of the Western Ghats known as the Nilgiris, is 8760 feet above the level of the sea. The opposite faces of these mountains differ remarkably from each other. Landward, there is a gradual slope to the tableland of the Deccan; seaward, almost perpendicular precipices, to speak generally, sink at once nearly to the level of the sea, at a distance ranging from 40 to 70 miles, but at one place approaching within six miles. From this peculiarity, aggravated by the heavy rains which the southwest monsoon dashes against the lofty barrier before it, the maritime strip, more particularly toward the south, presents that singular feature of stagnant shallow lakes known as the 'Backwaters.' See COCHIN.

GHATS (Hind. *ghāt*, step, Skt. *ghatta*, quay, from *ghatt*, to touch; connected with *gharsh*, to rub), or, as usually written, **GHAUTS**. Structures along the banks of rivers, erected to afford easy access to bathers. They are peculiar to Northern Hindustan, and line the river banks in most of the great cities, more especially those situated on the Ganges. A ghat consists, in general, of a long, high building, fronting the river, to which access is had by means of several flights of steps, connected with a broad quay, forming the essential part of the structure, as the wall or building is only for the protection of loungers from the sun's rays. The uniformity of the long lines of steps is broken by small projections, often crowned by kiosks, which relieve the eye. Though the Ganges, being the sacred river, is *par excellence* the river of ghats, one of the most beautiful in Hindustan is that at Maheswar, on the Nerbudda; and though Benares prides itself upon possessing the greatest number of ghats, it is almost rivaled by Ujjain and other cities. Consult Fergusson, *History of Indian and Eastern Architecture* (London, 1876).

GHAZAL', or **GHAZEL'** (Ar., love-poem, from *ghazila*, to be affectionate). An Oriental ode. It was a favorite form of lyrical compo-

sition among the Persians, and corresponds in some respects to our idea of the sonnet. The ghazal consists of from five to sixteen or seventeen couplets written in the same metre and according to fixed rules of rhyme. The opening couplet has its two lines rhyming with each other, and this rhyme is repeated in the second line of each succeeding couplet, which gives to the ghazal a uniformity that approaches monotony, according to Western, but not Eastern, standards of taste. In the last two lines, or couplet royal, called *makṭa* or *khātimah*, 'close,' the poet introduces his own name as a signature or envoy. Certain departures from these formal rules are found. As to subject, the burden of the ghazal is generally the praise of the poet's sweetheart, or his despair at her indifference; the beauty of the spring, the blush of the rose, the song of the nightingale, or the joys of wine and conviviality. Among the Persian poets, Hafiz (q.v.) is the most famous writer of ghazals, and a number of these have, so far as the form is concerned, been successfully rendered into English. Mention, for example, may be made of "Versions of Hafiz," by Walter Leaf (London, 1898). The German poets Platen, Rückert, and Bodenstedt have very skillfully adapted this form of composition in their 'Ghaselen.' On the latter, consult Remy, *Influence of India and Persia on German Poetry* (New York, 1901).

GHAZALI, *gā-zh'āl*, ABU HAMID MOHAMMED IBN MOHAMMED AL. A celebrated Arabian philosopher, born at Tus in Khorassan. He began his studies in his native town, and continued them at Nishapur. In 1091 he went to Bagdad, at that time a seat of Arabic learning, and became a teacher. His religious views, however, underwent a change, and in consequence he resigned his position after four years. He then made the pilgrimage to Mecca, traveled to Damascus and Jerusalem, and gradually came to adopt an ascetic life. In 1106 he returned to Tus, leaving it again at the solicitation of Mohammed ibn Malik Shah, to teach at Nishapur. He soon came back to Tus, and established a monastery for Sufites and a school for theological studies. Ghazali began with the Aristotelian system, but later turned against it in his *Tahafut al-Falasifa* (Destruction of Philosophers), a work which was answered by Averroës. His most important work was the *Ikhya ulum ad-din* (Restoration of Religious Sciences), in which he seeks to remove the dead formalism that had grown up in Islam, and to spiritualize it instead. An ethical work of Ghazali, *Ayyuha l-walad* (O Child), has been translated into German by Hammer-Purgstall (1838). Among his other works may be mentioned *Al-munkidh min ad-dalal*, an account of his philosophy, translated into French by Barbier de Meynard in *Journal Asiatique* (Paris, 1877); *Makasid al-falasifa* (Tendencies of the Philosophers), of which two chapters were published by Beer (Leyden, 1888); *Mizan al-amal*, a work on morals, a Hebrew translation of which was published by Goldenthal (1839); and *Ad-durrah al-fahira* (The Costly Pearl), a work on Mohammedan eschatology (text and French translation by Gautier, Paris, 1878). Ghazali's unpublished works are numerous, and treat of such varied subjects as theology, ethics, jurisprudence, philosophy, and

poetry. Consult Gosche, *Ueber Ghazzali's Leben und Werke* (Berlin, 1859).

GHAZAN KHAN, gâ-zân' kân. See MONGOL DYNASTIES.

GHAZI (gâ'zê) **MOHAMMED**. See SHAMYL.

GHAZIPUR, gâ'zê-pôor'. The capital of a district of the same name in the Northwest Provinces, British India. It extends for two miles along the left bank of the Ganges, in latitude 25° 32' N. and longitude 83° 39' E., 44 miles northeast of Benares (Map: India, D 3). The climate is hot and humid. Large quantities of roses are grown in the vicinity for the manufacture of rose-water and attar of roses. Ghazipur is the Government opium depot for the Northwest Provinces. Its chief objects of interest are the remains of the Chalestoon or Palace of Forty Pillars, used as the custom house, and a fine marble statue of Lord Cornwallis, who died here in 1805. Population, in 1891, 44,970; in 1901, 39,186.

GHAZNI, gâ'z'nê, or **GHEIZNI**, gî'z'nê. A city in the southeastern part of Afghanistan, over 80 miles southeast of Kabul, situated on the river Ghazni at an altitude of nearly 8000 feet (Map: Afghanistan, L 4). It is surrounded by a mud wall and derives considerable commercial importance from its position on the caravan route between Persia and India. Population, estimated at 10,000. A short distance from Ghazni are the ruins of Old Ghazni, once one of the finest cities of Asia, and capital of the Ghaznivides (q.v.). Ghazni was taken by the English under Lord Keane in 1839, and under General Nott in 1842.

GHAZNIVIDES, gâ'z'ni-vidz. A celebrated Mohammedan dynasty of 21 rulers, named from their seat in Ghazni, a city of Afghanistan. In the height of its power it possessed an empire extending from the Tigris to the Ganges, and from the Sihon or Sir-Darya to the Indian Ocean. The founder of the line was ALP-TIGIN, a freedman of Nasr I. of the Samani dynasty, who ruled over Ferghana, Kashgar, and Turkestan. Alp-Tigin, born in 880, was appointed Governor of Khorassan. In 961 he took possession of Ghazni and for fifteen years successfully withstood the Samani (q.v.). On his death, in 977, his slave SABUK-TIGIN was unanimously chosen as his successor. He was distinguished for prudence and valor as well as for humanity and justice. By him the kingdom was extended from the Indus to Khorassan and from the Gulf of Oman to the Sir-Darya or Jihon. Sabuk-Tigin died in 997, and was succeeded by his younger son ISMAIL. The elder son, MAHMUD YAMIN UD-DAULAH, the most famous of the dynasty, who had been appointed Governor of Nishapur in 994, hearing of his father's death, hastened to Ghazni. He deposed Ismail and assumed the reins of government in 999, with the title of Sultan. In the year following he took complete possession of Khorassan, and in 1001 commenced a series of twelve destructive inroads into Hindustan. On the 8th of Muharram (27th of November) he defeated Jaipal, King of Kabul and Lahore, near Peshawar, with immense slaughter. In 1006, while on his second expedition to India, he was recalled by the news that I-lak Khan of Kashghar, who in 999 had conquered the Samani, was

ravaging Transoxania. In 1007 and 1009 Mahmud made his third and fourth expeditions into Hindustan, and each time carried off an immense booty in money, jewels, and slaves. Returning to Ghazni, he made a liberal distribution from his treasures among the poor and the ministers of religion. Within the next few years he reduced Ghur, Jurjistan, and Khwarezm. In 1025 he was engaged in his last expedition against the Hindus, the famous expedition to Somnath in Southern Gujarat, where he obtained an enormous booty. In 1029 he conquered Irak, but on April 30th of the following year he died at Ghazni, aged sixty-three years. At this time the Empire of Ghazni was at the summit of its glory. Mahmud of Ghazni was a great conqueror and a patron of learning, but his cruelty and greed are dark blots on the short-lived empire which he founded as the first foreign dominion over India. He was succeeded by a younger son, MOHAMMED, who in October of the same year was compelled to resign the sovereignty to his younger brother, MASUD I. This prince was in 1037 signally defeated by the Seljuks (q.v.), who had taken possession of Khorassan. Though an able and warlike prince, misfortunes crowded thickly around his declining years. He was deposed in 1041, and murdered in the following year. During his reign the Seljuks took possession of Balkh, Khorassan, Khwarezm, Herat, and Irak. The sovereigns who in succession reigned in Ghazni were MAUDUD (1042-48); MASUD II. (1048); BAHADUD-DIN ALI (1048); ABD UR-RASHID (1048-53); TUGHRIL (1053); and FARRUKH-ZAD (1053-59). In their reigns there is little besides internecine quarrels at Ghazni, and the encroachments of the Seljuks on the west and north. The reign of Farrukh-zad, however, shed a bright lustre over the expiring glory of Ghazni, for the Seljuk Prince Daud, who thought to take advantage of the dissensions at Ghazni, and marched against it, was signally defeated by Nush-Tigin, the general of Farrukh-zad. Encouraged by this victory, the Ghaznvide forces marched into Khorassan and regained that province. On news of this second defeat, Alp-Arslan (q.v.) was sent by his uncle Tughril Beg (Togrul Bey) to stop the progress of the Ghaznivides. In the battle which ensued, fortune changed sides, and Nush-Tigin was totally defeated. A treaty of peace was then concluded. Farrukh-zad was succeeded by IBRAHIM (1059-99); MASUD III. (1099-1114); SHIRZAD (1114-15); ARSLAN (1115-17); and BAHRAM (1117-50). During the reign of this last prince, the Ghuri, a tribe inhabiting the mountainous country of Ghur in Afghanistan between Ghazni and Herat, began to make inroads upon the territory of Ghazni, and growing bolder by success, attacked and took the capital itself, driving Bahram across the Indus. But on the retreat of part of the Ghuri to their own country, Bahram retook his capital, and put to death the Ghuri prince, Saif ud-Din Suri. Learning this, the brother of the prince, Ala ud-Din Husain, hastened from Ghur, and having defeated Bahram, gave up Ghazni to be pillaged by his followers. Bahram was thus driven a second time across the Indus in 1149 and died in the following year. His son KHUSRU SHAH (1150-60) succeeded him, and took up his residence in Lahore. The many attempts which he made to repossess himself of Ghazni and the surrounding territory were unsuccessful. KHUSRU MALIK

(1160-86), the twenty-first and last monarch of the dynasty, occupied himself in the first part of his reign (1160-66) in extending and consolidating his Indian possessions, but subsequently his whole energies were required to repel the attacks of Shihab ud-Din Mohammed, Prince of Ghur, who, having conquered all the territory west of the Indus, now sought to drive the race of Sabuk-Tigin from their last possession. In 1184 Lahore was all that remained to Khusrū Malik, and the taking of that city by the Ghur Prince in 1186 put an end to the power of the Ghaznivides.

GHEBERS, gēbērs or gābērs, GABERS, GUEBERS, GHIAVERS (Turk. *Ghiaur*, or *Ghaur*). The adherents in Persia of the ancient religion founded or reformed by Zoroaster. As worshippers of Ormazd in Iran they correspond to the Parsis or Zoroastrian exiles in India. This small band, eight or ten thousand in number, stands with the Parsis to-day as the sole representatives of the faith of the Prophet of ancient Iran.

The name Gäber, Gēber, Ghēber, or Gueber, as infidel, is familiarly applied to the fire-worshippers in Persia; for example, in Moore's *Lalla Rookh* and in Byron's "Giaour." The origin of the name is open to discussion. It is commonly explained as a derivative from the Arabic *Kafir*, which is applied as unbeliever to all non-Mohammedans, and is supposed to have been given first to the Persian Zoroastrians by their Arab conquerors in the seventh century A.D. This explanation is doubtful on phonetic grounds. A second suggestion seeks to trace in *gaber* a tribal name or designation as implied in the name *Khabar* of the Talmud (Jebam. 63b., Gitt. 17a, etc.), and in Origen, *Contra Celsum*, 6291, who mentions Kabirs or Persians, and declares that Christianity has borrowed nothing from them. If a guess might be hazarded, one might be tempted to connect the word with the Pahlavi or Middle Persian *gabrā*, found also in Chaldean, in the sense of 'man,' which is applied to the Zoroastrians in the form *Mōg-gabrā*, or Magian man; and then assume a generalization in the sense of 'people, gentiles,' with the derogatory significance of unbeliever, infidel, pagan, heathen, as in the Gentiles of the Bible. Another name applied by the Mohammedans to this sect is *Atas-parast*, or fire-worshippers; or again *Majās*, from the Magi, their ancient priesthood; or also *Farsi*, i.e. Parsi, from Fars or Pars, the name of the Province of Persia. They designate themselves, however, as *Beh-Dīnān* ('those of the Good Faith').

The vicissitudes and misfortunes of these followers of the ancient Persian creed through history have been many and varied. Passing over the earlier history, to be dealt with in other articles, the battle of Nehavend (c.641 A.D.), and the final conquest of Iran by Islam, wrought a complete change in the religious tenets of Persia. The creed of Ormazd and of Zoroaster sank before the rising crescent of Allah and his Prophet; the Avesta gave place to the Koran; and the teachings of Mohammed were adopted by the Persians generally. Only a few sought freedom to worship Ormazd through flight and exile in India; these formed the later sect of the Parsis (q.v.). The small remnant that chose both to abide by their ancestral faith and to re-

main in their old home met with cruel persecution and oppression. So great, in fact, have been the trials of these devoted Zoroastrians for their faith, that within the last two hundred years they have dwindled down from a hundred thousand to a mere handful of representatives that still preserve the early creed. Through hardships they have been reduced largely to poverty and ignorance; but, thanks to the laudable efforts of their well-to-do brethren, the Parsis of Bombay, and the more liberal government of modern Persia, their condition has been greatly ameliorated within the last generation, and still more is being done to restore them to a fitting status of religious freedom in the land that gave them birth. Most of them that exist to-day are to be found in Yazd and Kirman, a few also in Teheran, Ispahan, Shiraz, Urumiah, or about the eternal fire of the naphtha wells of Baku. But, scattered as they are, downtrodden as they have been, they have still kept alive in Iran the spark of their fading worship there, and they still maintain a high reputation for honor, uprightness, morality, and obedience to law that characterizes their more fortunate Parsi brethren in India, and they may rightly claim their title to being men of the 'Good Faith.' See **AVESTA; PARSIS; PERSIA; ZOROASTER.**

GHEE, gē (Hind. *ghī*, from Skt. *ghṛta*, clarified butter, pp. of *ghar*, to drip). A kind of clarified butter used in many parts of India and the East, prepared from the milk of buffaloes or cows. The fresh milk is boiled for an hour or more; it is then allowed to cool, a little curdled milk added, and the curdled mass churned. When the butter begins to become rancid, which is usually the case after a few days, it is boiled till all the water and curd have separated. The fat is then removed, salted, often a little sour milk and some aromatic herbs added, and put into closed pots to be kept for use. It is said to keep for years when carefully prepared. The natives of many parts of India use it extensively, not only as a food, but in medicine and in religious rites. Its strong odor and disagreeable flavor are not attractive to Europeans.

GHEEL, gāl. A well-known Belgian colony for the insane, 26 miles east-southeast of Antwerp. It is a comparatively fertile spot, inhabited and cultivated by 10,000 or 11,000 peasants, in the midst of an extensive sandy waste, called the Campine. The farmhouses, though neat, and generally surrounded by trees and a garden, are evidently in the hands of the poor. They are sometimes built of brick; much more generally they are constructed of wattled or wicker work, thickly laid over with mud or plaster, and whitewashed. The dwellings are arranged into three classes, or cordons: those of the village proper; those scattered around in its immediate vicinity; and those collected into hamlets in the more distant and least reclaimed portions of the commune, which is about 20 miles in circumference.

Historically, Gheel is noticed as having been the spot where a woman of rank, said to have been of British origin, was murdered by her father, in consequence of her resistance to his incestuous passion. Pilgrims, the sick, the sorrowful, and the insane, visited the tomb of the Christian virgin; the last were restored to sanity and serenity. Dymphna became the tutelar saint

of those stricken in spirit; a shrine rose in her honor, which now, for ten centuries, has been consecrated to the relief of mental disease, and has collected around it hundreds of lunatics, chiefly of the poorer classes. Formerly, besides the benefit derivable from proximity to the ashes of the saint, and from the prayers of the Church, the afflicted underwent a sort of novitiate in a building adjoining the church, where they were chained to the wall, and subsequently passed under the mausoleum of their patron, etc.; but now there do not appear to be any other than the ordinary ministrations of the Church to which the patients belong resorted to as treatment.

About 1300 insane persons are lodged with the citizens of this community, or with 1000 heads of families, and are controlled and employed by them. The quiet and industrious reside generally one in each family in the town, the more excited in the suburban cottages, and the most unmanageable with the laborers on the confines of the commune. In the enjoyment of comparative liberty, and of what is called the free-air treatment, these patients are, upon the whole, contented, tranquil, and healthy. Each individual is maintained for about eleven cents to fifteen cents per diem. Until recently, this colony was merely a psychological curiosity; recently the anomaly and absurdity of treating all cases alike, and independently of medical aid, have led to the institution of a medical staff, the erection of a hospital, and the introduction of many salutary alterations in the relations between the insane and their custodians in classification and supervision. The compatibility of the seclusion of the insane with greater freedom, with domestic life, and association with the sane, have suggested the introduction of cottage asylums as a modification in the accommodation of this class in this country. Consult: Duval, *Gheel* (Paris, 1860); Brandes, *Die Irren-colonien* (Hanover, 1865); Rüdy, *Gheel* (Bern, 1874); Pilgrim, "A Visit to Gheel," in *American Journal of Insanity* (Utica, N. Y., 1886).

GHEGA, gǎ'gǎ, KARL VON (1800-60). An Austrian civil engineer, born in Venice. After being engaged in hydraulic engineering and in the construction of mountain roads in Northern Italy and the Tyrol, he spent several years in investigating railroads in the United States, and upon his return was intrusted with several important projects, such as the celebrated Semmeringbahn. He originated several improvements in railroad construction and wrote a number of important works on that subject, among which may be mentioned: *Uebersicht über die Hauptfortschritte des Eisenbahnwesens 1840-50* (3d ed. 1853); and *Ueber nordamerikanischen Brückenbau und Berechnung des Tragungsvermögens der Hoveschen Brücken* (1845).

GHENT, gĕnt (Fr. *Gand*, from OFlem. *Gend*). The capital of the Belgian Province of East Flanders, and one of the most important cities of Belgium, situated at the confluence of the Lys with the Scheldt, 31 miles northwest of Brussels (Map: Belgium, B 3). It is intersected by a number of streams and canals spanned by more than 250 bridges. The older portion with its narrow streets and gabled buildings bears a decidedly Flemish aspect, and possesses numerous buildings of great historical interest: the newer part of the city is well laid out and modern in its

architecture. The city is about eight miles in circumference, and contains extensive gardens and promenades. The chief ecclesiastical building is the Cathedral of Saint Bavon, with its unpretentious Gothic exterior and splendid interior. The crypt dates from 941; the last part of the building was completed only in 1554. Besides the architectural beauty of its interior, and its age, the cathedral is famous for its art treasures, among which is included the famous "Adoration of the Lamb" by the brothers Van Eyck, and one painting by Rubens. Near the cathedral stands the belfry, a square tower 375 feet high surmounted by a gilded dragon and containing a chime of 44 bells. It was begun in 1183. The Church of Saint Nicholas, the oldest in Ghent, was begun in the tenth century, but the larger part was constructed at the beginning of the thirteenth. It is built in the early Gothic style, and has an unfinished tower with ten turrets. The Church of Saint Michael, dating from the fifteenth century, is built in Gothic style, and contains a number of fine pictures, including the "Crucifixion" by Van Dyke.

The secular buildings of Ghent are also of great architectural beauty and historic interest. The town hall, of which the northern façade was constructed in 1518-33, and the eastern façade in 1595-1622, is regarded as one of the finest specimens of Gothic architecture in Belgium. The Palais de Justice, completed in 1846, is also an imposing building with a Corinthian portico, and a bronze statue of Metdepenningen in front. The Institut des Sciences, completed in 1890, is one of the largest public buildings of Ghent, and contains the lecture rooms and laboratories of the university, which was founded in 1816. Ghent has a number of old guild houses, and about twenty monasteries. Among the squares of the town the most noteworthy is the Marché du Vendredi, which has been the scene of the most important events in the history of the city. It has a bronze statue of Jacob van Artevelde in the centre, and a huge cannon, known as the Dulle Griete, in the north-western corner. In the northeastern part of the city is situated the nunnery of Grand Béguinage, founded in the thirteenth century. It is surrounded by walls and moats, and with squares, church, and small houses, presents the appearance of a town in miniature. The old castle or Oudeburg, constructed in the tenth century, was once the residence of the Counts of Flanders, and after a century of service as a factory has come into the possession of the city, which has restored it to its former appearance.

At the head of the educational institutions of Ghent is the university, with its four faculties of philosophy, law, natural sciences, and medicine. It has an attendance of about 750 students; its library contains about 350,000 volumes; and there are collections of coins and copper engravings. The laboratories of the university and the faculty of natural sciences have been transferred to the Institut des Sciences, opened in 1890. Besides the university, Ghent has a gymnasium conducted by the Jesuits, a seminary, an academy of painting, a conservatory of music, and several schools for manual training. There are also two theatres, an art museum, botanical and zoological gardens. Ghent

has greatly decreased in industrial importance since the fifteenth century, when it was one of the chief centres of the textile industries of Europe. It has still a considerable number of linen, woolen, and cotton mills, lace-factories, tanneries, breweries, etc. Among the chief products of Ghent are flowers, which are exported all over Europe. Ghent has good communication facilities, and its commerce is still of considerable magnitude, the exports consisting chiefly of manufactured goods and agricultural products. Ghent is the seat of a court of appeal, a commercial court, and a number of consular representatives. The population was 131,431 in 1880; 148,729 in 1890; and 160,949 in 1900. The numerical superiority of females is very pronounced, the proportion between the sexes having been 113 to 100 in 1890.

Ghent is mentioned in history as early as the seventh century. About the year 868, Baldwin Bras-de-fer, the first Count of Flanders, built a fortress here as a defense against the Northmen. Under the counts of Flanders, Ghent continued to prosper and grow until, in the fourteenth century, it was able to send 50,000 men into the field. The wealth of the citizens of Ghent, and the unusual measure of liberty which they enjoyed, encouraged them to resist with arms any attempt to infringe upon their peculiar rights and privileges. This readiness to arm in their own defense is exemplified in the struggles in which Jacob and Philip van Artevelde (qq.v.) played a memorable part. For many years Ghent maintained a vigorous but unavailing resistance against the dukes of Burgundy, who sought to be recognized as counts of Flanders. In 1540 the city, having ventured to defy the Emperor Charles V. (a native of the place), was terribly chastised and deprived of its liberties. In the various wars in which the Netherlands have been the battleground, Ghent suffered severely, and was frequently taken. For twenty years, from 1794, Ghent belonged to France, and was the capital of the Department of the Scheldt.

GHENT, TREATY OF. A treaty between the United States and Great Britain, which ended the war between the two countries known as the 'War of 1812.' The American negotiators were John Quincy Adams, James A. Bayard, Henry Clay, Jonathan Russell, and Albert Gallatin. Of these Bayard and Gallatin had been sent to Saint Petersburg in 1813, to join Adams in action upon Russia's offer of mediation, under express instructions to secure a stipulation against impressment. Russia's good offices were declined by England, while the termination of the Napoleonic wars so altered conditions that the American commissioners were given less stringent instructions both as to impressment and as to the fisheries. The British representatives were Lord Gambier, Henry Goulburn, and William Adams. After prolonged negotiations the treaty was signed by the respective commissioners on December 24, 1814, was ratified by the United States Senate on February 17, 1815, and was formally proclaimed by President Madison on the following day. Its main provisions were: (1) Restoration of all territory, places, and possessions taken by either party from the other during the war, except certain islands; (2) Article IV. provided for the appointment of a commission to decide to which of the two powers,

according to the boundary stated in the Treaty of 1783, certain islands in and near Passamaquoddy Bay belonged; and the commission failing to come to a decision, the subject was to be referred to some friendly sovereign or State; (3) Articles V.-VIII. provided for commissions to settle the line of boundary as described in the Treaty of 1783—the commission to settle the line from the River Saint Croix to where the forty-fifth parallel cuts the River Saint Lawrence (called the Iroquois or Cataragua in the treaty); another to determine the middle of the water communications from that point to Lake Superior; and a third to adjust the limits from the water communications between Lakes Huron and Superior to the most northwestern point of the Lake of the Woods; and (4) Article IX. bound both parties to use their best endeavors to abolish the slave trade, as being 'irreconcilable with the principles of humanity and justice.' The treaty failed, however, to speak of the impressment of American seamen, the chief cause of the war, or of the claims of the United States to participate in the Newfoundland fisheries, recognized in the Treaty of 1783, or of the question as to British and American naval forces on the northern lakes, or the rights of neutrals. All these questions, especially that as to the fisheries, became the subjects of much subsequent negotiation.

GHENT, UNIVERSITY OF. A Flemish university founded by King William I. of Holland, in 1816. It was housed in the town hall until 1820, when the old Jesuit college was remodeled for its use. At the time of the revolution of 1830 the university was seriously crippled by the suppression of two of its four faculties; in 1835, however, these were restored. Various special schools have been, from time to time, merged in the university. There are about 750 students, including over 100 foreigners. As in Liège, the institution is maintained by the State. The libraries of the city and university are combined in one collection, containing over 350,000 volumes, especially rich in the history and literature of the Netherlands; there are also many valuable manuscripts.

GHERARDESCA, gā'rār-dēs'kà. An Italian family of Tuscan origin, which enacted a conspicuous part in the history of the Italian republics in the thirteenth and fourteenth centuries. Their large territorial possessions lay between Pisa and Piombino. In the thirteenth century the counts of Gherardesca exercised a preponderating authority in the Republic of Pisa, and were at first prominent Ghibellines, and enemies of the Visconti of Milan, who headed the Guelphs, but later seemed inclined to favor the Papal party. The most celebrated of this family is Count Ugolino della Gherardesca, whose name and fate have been invested with undying interest by Dante in the *Inferno*. Count Ugolino, according to Ghibelline accounts, was possessed of a lawless ambition and a subtle unscrupulous spirit. Allying himself with the Guelph forces of Florence and Lucca, he compelled the Pisans in 1276 to restore him his territories, of which he had been deprived. No sooner was he reinstated in his possessions than he began to devise anew ambitious schemes. The war of the Pisans with the Genoese afforded him the opportunity he desired. In the battle of Meloria, 1284, Ugolino is said to

have contrived the defeat of the Pisans. He was, however, named Captain-General for ten years. From the time of his election he gave free scope to his vindictive nature, persecuting and banishing all who were privately obnoxious to him, till at length a conspiracy was formed against him, headed by his former supporter, the Archbishop of Pisa. He was thrown into the tower of Gualandi with two sons and two nephews, in 1288, where they all perished by starvation, for which reason their dungeon has since borne the name of the Tower of Hunger. In the fourteenth century the family again rose into importance, and several members were prominent in the service of Pisa. Consult: Sismondi, *History of the Italian Republics* (New York, 1870); G. del Noce, *Ugolino della Gherardesca* (Rome, 1890).

GHERARDI, gâ-râr'dê, BANCROFT (1832-1903). An American naval officer. He was born in Jackson, La., served as midshipman in the navy from 1846 to 1850, and entered the Naval Academy in 1852, where, in the same year, he was promoted to passed midshipman. During the Civil War he commanded successively the *Chocorua* and the *Port Royal* of the West Gulf Blockading Squadron, and with the latter vessel pursued the Confederate gunboats *Morgan*, *Gaines*, and *Selma*, during the battle of Mobile Bay (August 5, 1864). After the war he attained the rank of rear-admiral in 1887; commanded the Brooklyn Navy Yard (1887-89; 1893-94); and in 1893-94 was commander-in-chief of the North Atlantic Squadron. He was in charge of the Columbian international naval parade and review in New York Harbor in 1893, and was vice-commander of the New York Military Order of Foreign Wars. He was retired from active service in 1894.

GHERARDI DEL TESTA, gâ-râr'dê del tês'tâ, Count TOMMASO (1818-81). An Italian dramatic writer, born at Terricciola (Province of Pisa). He studied at the University of Pisa, fought against Austria in 1848, and in addition to his activity in the practice of law at Florence wrote poems, works of prose, fiction, and more than forty comedies. These last, his most important work, excel in dialogue and character-drawing, but often fail of adequate dramatic structure. They include *Il sistema di Giorgio* and *Il padiglione delle mortelle*, and were collected in 1856-66, and more completely in 1872-83.

GHETTO, gêt'tô (of doubtful etymology; possibly from It. *borghetto*, little town, diminutive of *borgo*, town). A Jewry. Originally the name 'ghetto' was applied to the Jews' quarters in several cities of Italy and Bohemia; but it is now popularly used of the part of any city where Jews are numerous. Both the name and the thing originated in Rome, in the time of Pope Paul IV., who first compelled the Jews to dwell within an inclosure set apart for them on the left bank of the Tiber, between Ponte Sisto and Ponte San Bartolommeo, and forbade their appearance outside of that quarter unless the men wore a yellow hat and the women a veil of the same color, to distinguish them from Christians. This ghetto was removed in 1885. See Philipson, *Old European Jewries* (Philadelphia, 1894).

GHIBELLINES, gîb'el-lînz or -lênz. See GUELPHS AND GHIBELLINES.

GHIBERTI, gâ-bâr'tâ, LORENZO (1378-1455). A Florentine goldsmith, and one of the chief

sculptors of the early Renaissance. He was the son of Cione di Ser Buonaccorso and Madonna Fiore, a lady of distinguished Florentine family. His mother left his father soon after his birth, but Lorenzo found a foster-father in the goldsmith Bartolo Ghiberti, with whom she lived, and who married her after her first husband's death. He adopted the lad and taught him his art, but Lorenzo was more drawn to painting, which he studied, perhaps under Gherardo Starnini. Fleeing from the pestilence in 1400, he went to Rimini, where he decorated a room of the palace of Carlo Malatesta. He returned to Florence, notwithstanding the inducements offered by Malatesta, in response to a letter from his stepfather, in 1401. The Merchants' Guild had decided to adorn the baptistery with two new bronze doors, and the signory invited all the artists of Italy to compete. Among the competitors of Ghiberti were Brunelleschi, Jacopo della Quercia, and Niccolò d'Arezzo. The subject to be presented was a bas-relief of the "Sacrifice of Isaac."

Ghiberti was much aided by the counsel of his adopted father, who criticised his designs, and submitted them to competent citizens and strangers before the final one was cast. The judges were unable to decide between Ghiberti and Brunelleschi. Both of the winning designs are preserved in the Museo Nazionale, Florence, and Ghiberti's certainly appears superior in both composition and line. Recognizing this, Brunelleschi generously withdrew, and on November 14, 1403, the commission was awarded to his rival.

The doors were not completed and set up until April 14, 1424. Ghiberti made use of a number of assistants, among whom we find Donatello and Michelozzo, and was much aided by his stepfather. Twenty of the panels represent scenes from the "Life of Christ"; four are devoted to the "Fathers of the Church," and four to the "Evangelists." These representations fulfill the highest demands of relief, and, considered as reliefs, stand higher than those of the more celebrated east portal. Among the best of the panels are the "Annunciation," the "Raising of Lazarus," the "Kiss of Judas," the "Birth of Christ," the "Purification of the Temple," and the "Youthful Christ Teaching." The figures of the "Evangelists" and of the "Fathers of the Church" are dignified and admirably draped, especially Saint Matthew. All of the reliefs show reminiscences of the Gothic, especially in the garments, but the ornamentation is antique. The corners of the panels are decorated with heads of prophets and sibyls.

The north portals gave such satisfaction that on January 2, 1424, Ghiberti received an order for the east gate—the famous "Paradise Portals." The subjects for these were selected from the Old Testament by Leonardo Bruni, the Chancellor of the Republic, but the designs were by Ghiberti himself. The technical skill displayed in handling relief is most remarkable; the composition is faultless, and sometimes four different subjects are handled in the same fashion, and yet without conflict. In some panels there are as many as one hundred figures, with architectural and landscape backgrounds.

Among the finest reliefs are the first, representing in one panel the "Creation of Adam," the "Creation of Eve," the "Fall of Man," and the "Expulsion from Paradise." In these the

GHIBERTI
BRONZE DOORS OF THE BAPTISTERY, FLORENCE

groups of angels accompanying the Creator are especially beautiful. Another fine panel is "Moses upon Sinai," in which we see the expectant, terrified throng of the Israelites below, among whom is the famous group of a "Mother and Her Children." Equally beautiful are the twenty-four statuettes of prophets and other scriptural personages, by which the panels on each portal are surrounded. There are also heads of prophets and sibyls at the angles of each relief, among which are two especially interesting ones, representing Ghiberti and his stepfather. The door-frame is carved with tasteful Renaissance ornamentation of foliage and animals.

While executing these two great works Ghiberti found time for others. Among these were two fine bronze reliefs for the font of the Baptistery of Siena (1417-27), representing episodes from the "Life of John the Baptist." Between 1432 and 1440 he also designed the bronze shrine of Saint Zenobius, in the Cathedral of Florence, the front of which contains a beautiful relief of the "Saint Restoring a Dead Child to Life," and the back six angels in relief. He also designed a grave-slab for Leonardo Dati, who died in 1423, in Santa Maria Novella, and two others in Santa Croce, all of which are much defaced by treading.

Ghiberti's chief strength, however, was in relief work on a small scale. Accordingly, we find in him the most celebrated goldsmith of his day. None of his works as a goldsmith survives, but in his second *Commentary* he himself mentions the principal examples. In 1419 he made for Pope Martin V. a mitre, covered with leaves of gold, among which were many different figures, and a cope button, adorned with a figure of Christ. He made another mitre in 1439 for Pope Eugenius IV., containing precious stones worth 38,000 ducats, and surmounted by figures of Christ and the Virgin with angels. He also set an antique intaglio, belonging to Giovanni de' Medici, between the wings of a golden dragon, crouching in a bed of ivy-leaves.

In statuary Ghiberti was less successful. He executed but three statues in bronze, all of which adorned the façade of Or San Michele. "John the Baptist" (1414) is the earliest example, quite in the style of the first portal; "Saint Matthew" (1420-22), cast with the aid of Michelozzo, looks like a Roman orator; "Saint Stephen" (1428) is the finest of all, simple in treatment and graceful in line.

Ghiberti also figured as an architect. He is mentioned in the record of 1520 as an associate of Brunelleschi in building the cupola of the cathedral at Florence; but if we may believe Vasari, he solicited this position, and perpetually annoyed his colleague by his endeavors to steal his plans. Brunelleschi feigned illness, and Ghiberti's incompetency became apparent. Whether or not this story be true, Ghiberti's *Treatise on Architecture*, which survives in manuscript form, certainly shows incompetency. As a designer for glass-painting he had greater success. Some of the finest glasses in the cathedral in Florence were carried out after his designs by Bernardo di Francesco, including those of the Chapel of Saint Zenobius, the middle window of the façade, and one in the drum of the cupola. As a citizen of influence Ghiberti was selected Chief Magistrate of Florence, and presented by the signory with a farm near Settino, in recognition

of his services as an artist. He died December 1, 1455, and was buried in Santa Croce.

His son and pupil, VITTORIO, was a sculptor and goldsmith of note, who assisted his father in the second door. In 1454 he made a design for the tapestry of the tribuna of the Palazzo della Signoria, and in 1478 a bronze reliquary for the cathedral. Among Ghiberti's other pupils and assistants were Michelozzo, Lamberti, and Antonio Pollajuola.

BIBLIOGRAPHY. Ghiberti himself wrote a work, the *Commentarii*, or commentaries on the art of Florence, in which he did ample justice to himself. It is preserved in manuscript form in the Biblioteca Magliabecchiana, Florence, and was published in Lemonnier's revision of Vasari's lives (Florence, 1846-57). There is a French translation in Perkins, *Ghiberti et son école* (Paris, 1897). The other chief source for his life is the biography in Vasari, *Vite*, edited by Milanese, vol. ii. (Florence, 1878-85), English translation by Blashfield and Hopkins (New York, 1897). The chief modern work on Ghiberti is that of Perkins, cited above. Consult also: Perkins, *Tuscan Sculptures*, vol. i. (London, 1867); Scott, *Ghiberti and Donatello* (London, 1882); Rosenberg, "Lorenzo Ghiberti," in Dohme, *Kunst und Künstler Italiens*, vol. i. (Leipzig, 1878); and Reymond, *La sculpture florentine* (Florence, 1898-99).

GHİKA, gē'kă. A princely family which gave a number of hospodars to Moldavia and Wallachia. The founder of the house was George Ghika, an Albanian by birth, who, through the favor of his compatriot, the Grand Vizier Mohammed Kiu-prili, was raised to the dignity of Hospodar of Moldavia in 1658, and for a brief period (1660) was also Hospodar of Wallachia. His son, Gregory Ghika, ruled in Wallachia from 1660 to 1664, and from 1672 to 1674, and received from the Emperor Leopold I. the title of Prince of the Holy Roman Empire. Of subsequent members of the family those calling for special notice are Alexander, Gregory, Jon, and Helena, though the family as a whole has been active in Rumanian affairs, and always associated with the Liberal and Nationalist Party.

ALEXANDER GHİKA X. (1795-1862) became Hospodar of Wallachia in 1834. He founded schools for primary instruction in every village, lightened the burdens of the peasantry, began the enfranchisement of the gypsies, and assisted in the organization of a national party, known as 'Young Rumania.' Russia took alarm and gradually, under her influence, a twofold opposition was excited against him, on the part both of the extreme liberals and of the old boyars or landed proprietors, who formed the Conservative Party, and were his personal enemies. After many intrigues he was removed from his office in 1842. He died in 1862. Consult Bibesco, *De la situation de la Valachie sous l'administration d'Alexandre Ghika* (Brussels, 1842).

GREGORY GHİKA (1807-57) was one of the chiefs of the liberal opposition in Moldavia under the Hospodar Michael Sturdza (1834-49), whose selfish policy was subservient to the designs of Russia. In 1849 the Sultan appointed him Hospodar of Moldavia. Hampered during a part of his tenure by the Russian occupation, he was able to accomplish much when freed from this impediment. He organized a good police system, augmented the effective force of the militia, founded

schools for superior and secondary instruction at Galatz, Hush, and elsewhere, promulgated an administrative code—the first great step toward the reform of abuses—increased municipal resources, and at his own expense built aqueducts and printed important historical manuscripts. He brought about a radical reform of the penitentiary system, the abolition of serfdom (1855) and of the censorship of the press (1856), and the establishment of foreign merchant companies for the navigation of the Pruth and the Sereth (1856). He encouraged the growth of a spirit of unity among the peoples of Moldavia and Wallachia. In 1856 Gregory was superseded in his office and went to reside in France. He committed suicide, August 26, 1857, at Meudon.

JON GHİKA (1817-97), a nephew of Alexander X., was born at Bucharest, and after studying at Paris became, in 1842, professor of mathematics and political economy at the University of Jassy. Having become a member of the national party which opposed the establishment of Russian domination in Wallachia, he was one of the leaders of the revolution of June, 1848, which resulted in the overthrow of the Hospodar, George Bibesco. He was sent by the short-lived Provisional Government as diplomatic representative to Constantinople, where his exceptional abilities gained him the favor of the Sultan, who in 1856 made him Prince of Samos. He returned to Wallachia in 1857, served in the Ministerial Council under Prince Alexander John Cuza, and was twice Premier under his successor, Prince Charles of Hohenzollern, 1866-67 and 1870-71. From 1881 to 1889 he was Ambassador at London. He died at Bucharest, May 4, 1897.

HELENA GHİKA. See DORA D'ISTRIA.

GHILAN, or **GILAN**, gè-lân'. A border province of Persia, occupying a narrow strip of land along the Caspian Sea (Map: Persia, C 3). Its area is estimated at over 6000 square miles. The coastland is low and overgrown with thick forests, while the southern part partakes of the character of the Elburz region. The climate is moist and unhealthful. The well-watered and fertile coastland produces rice, peaches, figs, and other southern fruits. In the more elevated regions grain is grown and cattle are reared. Silk and oil of roses are produced extensively. The population, estimated at about 200,000, is made up of the aboriginal Iranians, with Kurdish and Turkish immigrants. They speak either a Persian dialect, termed Gileki, or Tat, which is a pure Iranian tongue. In religion they are mostly Mohammedans and belong to the Shiite sect. The principal town is Resht (q.v.).

GHILZĀIS, gèl-zî'ez. A tribe of Pathan stock in Eastern Afghanistan, Aryan by language. Holdich (1899) considers them as ultimately of Turkish origin, but this lacks proof. They are a very warlike and restless people.

GHIRLANDAJO, gèr-lân-dâ'vò. A family of Florentine painters. Their real family name was Bigordi, and the name Ghirlandajo or Grillandajo (garland-maker) was first given to TOMMASO BIGORDI, a goldsmith, because he invented a fashionable silver wreath, used in ladies' head-dresses. His son DOMENICO (1449-94), the chief member of the family, was born in Florence, and brought up in his father's trade. He studied painting and mosaic under Alesso Baldovinetti, and was also influenced by Castagno

and Verrocchio (q.v.). The earliest record of his activity is in 1475, when we find him employed in the Vatican library at Rome. The works executed there have been lost, but there is a possibility that his fresco "Call of Saints Peter and Andrew," in the Sistine Chapel, was painted then, although it is usually assigned to 1485. It is, perhaps, the best of the fifteenth-century paintings of the Sistine Chapel, being excellent in composition, with good landscape and perspective; the color is unattractive. His frescoes in the Capella Fina, in the Collegiate Church of San Gimignano, treating the "Life of Saint Fina," were completed, for the most part, before 1475. They are especially remarkable for the modesty and grace of the female figures. The frescoes in Ognisanti, Florence, finished in 1480, show the painter fully developed. Of these only two paintings survive, the "Last Supper" and "Saint Jerome." The former is probably the best representation of the subject painted in the fifteenth century, and far excels his later fresco of the same subject in San Marco. His Saint Jerome is a companion piece to Botticelli's Saint Augustine. From 1481 to 1485 Domenico was occupied in the Palazzo Vecchio, Florence, which in point of historic decoration was long the rival of the Sistine Chapel at Rome. Of all its frescoes only Ghirlandajo's survive, and of these the decorations of the chapel have been spoiled by restoration. His "Saint Zenobius Enthroned" is a grand architectural composition.

On December 15, 1485, he completed the frescoes of the Sassetti Chapel in Santa Trinità, Florence. The figures of the donor and his family on either side of the altar are comparable in the dignity of their realism with those of the Ghent altar by the Van Eycks (q.v.). The frescoes represent scenes from the life of Saint Francis, and show the decided influence of the same subject by Giotto in Santa Croce. The heads are nearly all portraits, and the scenes are set amid views of Florence. This work is better in color and in technique than any of his previous productions; but the finest of his frescoes are those in the Tornabuone Chapel, Santa Maria Novella, finished in 1490. Here, too, are figures of the donors; in lunette above is God the Father surrounded by the patron saints of Florence. Below them are the "Annunciation" and the "Baptist" on either side, typifying the subjects of the frescoes represented, that is to say, the "Legend of the Virgin" and the "Life of John the Baptist." On the vaulted roof are frescoes representing the "Four Evangelists."

Domenico's easel pictures are not of equal importance; his art was more adapted to monumental fresco. Among his chief easel pictures, all of which are painted in tempera, are the altarpiece of the Sassetti Chapel (1485), now in the Uffizi; "Coronation of the Virgin" (1486), in the Palazzo Publico, Narni; the circular "Adoration of the Kings" (1487) in the Uffizi, and the altarpiece of Santa Maria degli Innocenti representing the same subject. The latter is one of his best works. A dignified work is the "Virgin Enthroned," now in the Uffizi. The altarpiece of Santa Maria Novella (1490) is divided between Berlin and Munich, and his last easel picture, "The Visitation" (1491), is in the Louvre.

Domenico passed practically all his life in Florence, where he died January 11, 1494. He was the painter *par excellence* of Florentine life.

GHIRLANDAJO
"NATIVITY OF THE VIRGIN MARY," FROM THE FRESCO IN THE CHURCH OF SANTA MARIA
NOVELLA, FLORENCE

He represents the highest development of realism in the art of his century. He united in himself in a remarkable manner all the tendencies of Florentine art, ancient and modern, Masaccio, even Giotto, having influenced him. From the purely technical side he was one of the greatest painters that Florence ever produced. Although somewhat lacking in originality, he excelled in composition, was a fine draughtsman, and, for Florence, an excellent colorist.

DAVIDE (1452-1525) and BENEDETTO GHIRLANDAJO (1458-97), brothers and pupils of Domenico, assisted their brother, but painted no independent works that survive. The mosaic of the "Annunciation" over the first north portal of the Cathedral of Florence is the work of Domenico and Davide. Among Domenico's other pupils were his brother-in-law Bastiano Mainardi, Francesco Granacci (q.v.), and, for a brief time, Michelangelo.

RIDOLFO (1483-1561), son of Domenico, was eleven years old when his father died, but received his artistic education in his father's studio, which was conducted by Granacci and Davide Ghirlandajo. He assisted the former in some of his works, but about 1503 he came wholly under the influence of Leonardo da Vinci (q.v.), and painted a number of excellent works, which are hardly to be distinguished from Leonardo's. In fact, paintings formerly attributed to the latter, like the "Annunciation" in the Uffizi, the "Goldsmith" in the Pitti Palace, and the portrait of an "Old Man," in Palazzo Torregiani (Florence), are by Ridolfo. His best works of this character are the "Coronation of the Virgin" (1503), in the Louvre, and the altarpiece of San Jacopo in Ripoli (1505), and the "Betrothal of Saint Catherine." Somewhat later he came under the influence of Raphael, as may be seen in his excellent portrait of an "Old Woman" (1509) in the Pitti Palace. He is reputed by Vasari to have assisted Raphael in the draperies of the "Belle Jardinière," but to have refused an invitation by him to settle at Rome. His most ambitious works are the "Coronation of the Virgin," the altarpiece of the Cathedral of Prato; the "Virgin Adored by Saints," altarpiece of San Pietro Maggiore, Pistoja; and two scenes from the "Life of Saint Zenobius," in the Uffizi. In later life his profession degenerated into a trade; he employed a large number of assistants, and his work became mannered and stiff.

(Florence, 1878-85); English translation by Blashfield and Hopkins (New York, 1897); Crowe and Cavalcaselle, *History of Painting in Italy* (London, 1866); Lübke, *Geschichte der italienischen Malerei* (Stuttgart, 1878-79); Steinmann, "Ghirlandajo," in Knackfuss, *Künstler-Monographien* (Bielefeld, 1897); Woltmann and Woermann, *History of Painting*, vol. ii. (New York, 1901).

GHISLAIN, gēs'lān'. See MÉRODE, FRANÇOIS XAVIER.

GHISLANZONI, gēs'lān-zō'nē, ANTONIO (1824-93). An Italian singer and author, born at Lecco. He was a singer in the Milan theatre, and when he lost his voice became a journalist, founded the satirical paper *L'Uomo di Pietra* (1857), and was editor of the *Gazzetta Musicale*. He wrote a number of books for opera, among them the libretto of Verdi's *Aida*, and several

novels, including *Gli artisti da teatro* (1865) and *Le donne brutte* (1870).

GHIZEH, or GIZEH, gē'ze. An Egyptian village on the left bank of the Nile, opposite the island of Roda and about three miles from Cairo. Although now fallen into decay, it is said to have once contained magnificent palaces which, in later times, the Mameluke princes used as a summer residence, and it was a place of some importance in the Middle Ages. Near Ghizeh is the viceregal palace, originally built for a harem, which in 1889 became the repository of the great collection of Egyptian antiquities removed in that year from Bulak. The collection has recently been transferred to Cairo. The great Pyramids (q.v.) lie about five miles west of Ghizeh.

GHIZNI, gīz'nē. See GHAZNI.

GHO'GRA. See GOGRA.

GHOR, gōr. See EL-GHOR.

GHORKAR, gōr'kār (Pers. *gōrkhar*, wild ass). The name in Western India and Beluchistan for the local variety of the Asiatic wild ass, which differs from the *kiang* in being somewhat paler, less reddish in color, and having a broader dorsal stripe. See KIANG.

GHOST MOTH. A moth (*Hepialus humuli*) very common in many parts of Great Britain, and of which the caterpillar, known as the 'otter,' often commits great ravages in hop plantations, devouring the roots of the hop. It feeds also on the roots of the nettle, burdock, and some other plants. This moth belongs to a family (Hepialidæ) often called swifts from their rapid flight. The male ghost moth is entirely of a satiny white color above, the female yellowish with darker markings; both sexes are brown on the under side. They are to be seen flying about in the twilight, not unfrequently in churchyards, from which circumstance, and from the white color of the males and their sudden disappearance in the imperfect light, they derive their name. The caterpillar, which is sometimes two inches long, is yellowish white, with scattered hairs. It spins a large cylindrical cocoon among the roots on which it has been feeding, and there becomes a chrysalis. The family is represented in North America by species harmful to the alder and other trees.

GHOSTS (AS. *gāst*, OHG. *geist*, Ger. *Geist*; ultimately connected with OIr. *goet*, wound, Skt. *hēdas*, wrath). The spirits of the dead as manifested to the living. The belief in ghosts is one of the earliest of all religious phenomena, and forms the foundation of many concepts and practices in cults from the most primitive faiths to the most highly spiritual. It is found in one form or another at all ages and among all peoples. To such an extent does belief in ghosts prevail, that one school of comparative religion (see RELIGIONS, COMPARATIVE), of whom Herbert Spencer and Julius Lippert are the chief representatives, has sought to find the origin of all religion in ghost-cults. This view must be regarded, however, as an erroneous, because one-sided, theory, but the importance of ghost-worship as a religious factor cannot be denied, and it is certainly one of the main sources of religious belief. Its chief development is found in the widespread existence of ancestor-worship,

as will be explained. It is also the foundation of all eschatology (q.v.), or belief in future life. The notion of survival of a certain mysterious part of man, which may be called conveniently the soul, is found at a very early stage in religious development. Whether this belief is, and always has been, universal is a problem which may be insoluble. While many observers deny the existence of ghost-belief as well as of all religious concepts among certain extremely primitive peoples, as the Andaman islanders, a prudent skepticism renders one distrustful of their conclusions, for it may be stated as a general fact that religious beliefs are particularly liable to concealment and to misinterpretation. This reticence may be due either to lack of method or to misunderstanding on the part of the investigator, or to a fear entertained by the individual questioned lest the knowledge gained from him may be used to his hurt.

The ghost-concept in its most primitive form seems to be developed as follows: The phenomenon of dreams is one of the starting-points. According to the reasoning of the primitive mind, the self, while the body is unconscious and inert, wanders to places familiar or even unknown, experiences pleasure and pain, converses with friends perhaps dead, and performs other things which have no connection with the body. It is therefore a dangerous thing, in the belief of many savage tribes, to wake a sleeper suddenly, lest his soul may not return in time. Among some peoples the soul is even supposed to assume a visible shape, as that of a mouse, which comes from the sleeper's mouth. From sleep and dreams the savage proceeds by analogy to death. To him the distinction between slumber and death is one of degree rather than of kind, and it is well known how universal is the belief that sleep and death are near akin. As in slumber the soul left the body for a time, but returned to it, so in the long sleep, as the primitive mind regards it, of death, the soul is supposed to remain near the body. This belief, for instance, is found even in such developed faiths as Parsiism and Mohammedanism, while other religions, as the ancient Egyptian, teach separate phases of the soul, one of which, like the Egyptian *ka*, remains near the corpse. As it is obviously impossible to keep a corpse from dissolution, and as the progress of decay renders the body more and more uninhabitable for the spirit which has left it, the soul, or the ghost as it may now be called, becomes a source of much anxiety to the kinsmen and other friends of the dead. It must be borne in mind, as has been stated in the article on demonology (q.v.), that in primitive religion the element of terror is one of the most important factors, and at first exercises a far greater influence than hope. The ghost is, then, more terrible than was the man whose body it had animated. It is no longer limited by bodily restrictions, it can traverse space with infinite speed, and may be invisible. Fortunately, and somewhat curiously, the ghost, like demons generally, is rather stupid, and is also bound by certain limitations. Upon such an apparently flimsy foundation, which is, however, logical to the primitive man, is built a complicated system of mortuary customs (q.v.), and the concept of immortality. The ghost, which, as has been said, delights to hover around its earthly home, is

not a cheerful companion to the living, and must therefore be kept away. This is accomplished by various methods, as by building a new hut for the survivors, or, more easily, by carrying the corpse out by a hole broken in the side of the dwelling, which is subsequently walled up. The ghost is then unable to find its way back, and the house is safe from its invasion. The superstition here noted still survives. The so-called haunted houses and haunted rooms are cases in point, and it is important to note that it is the malignant ghosts, chiefly those who have been involved in murder or other evil acts, which especially linger around the scene of their earthly activities. The beneficent ghost plays but a small part as compared with the maleficent one. To avert the influence of maleficent ghosts, who have already been considered under the title demonology (q.v.), various forms of sacrifice and magic are employed. These ceremonies have as their primary object the satisfaction of the ghost's wants. These needs are conceived as being practically the same as they are on earth. Thus the bow and arrows are laid with the warrior, a woman's jewelry is buried with her, and a child's toys rest beside its body. It was also common in many places, notably in Dahomey and Polynesia, to sacrifice slaves to attend their master in the spirit world, while among the ancient Germans horses and even wives (as in the Indian suttee) were often slain at the funeral pyre. It is also probable that to the wish to appease ghosts many of the elaborate mourning customs of primitive peoples may be traced. Under this category come such acts as shaving the hair, cutting the flesh, fasting, neglect of the toilet, use of unbecoming clothing, and the like. It is, of course, true that at a comparatively early time the development of civilization rendered mourning for the dead an act of affection and not of fear; but it is hard to believe that the savage who put to death the aged members of his tribe was moved by any high ideals in the beginning of mortuary customs. In line with mourning are the offerings of food, drink, clothing, and, as in China, of money to the deceased.

Thus is evolved one of the most widely spread of all cults—ancestor-worship. Gradually beside the malignant ghost the benignant one appears, and by a process quite as natural. The interest which the father during his lifetime feels in his family is logically continued after his death, when the social life becomes more stable. It is also proper that his sons should be the ministers of this cult, and thus the imperative necessity felt among many peoples for sons. If a man dies sonless, his ghost will lack care, and the ancestor-cult therefore exercises a far-reaching influence on early family life. As already noted, however, this worship has its limitations. Even among civilized races, except in the comparatively rare instances where genealogical tables are constructed, men seldom know the names of their ancestors further back than the fourth generation. Translating this into terms of primitive life implies that the ghosts of remote ancestors perish, or become absorbed into a vague spirit-world. This leads to the conclusion that all men do not necessarily become ghosts, or at least have but an evanescent ghosthood. It may be stated as generally true that only those men survive after death as ghosts who have been so re-

markable for some reason or other as to command special attention while living. This is clearly shown by the development of the immortality concept in Judaism. (See **ESCHATOLOGY**.) Not in ancestor-worship alone does the ghost play an important part. Many phenomena in nature-worship (q.v.) and in the various aspects of totemism (q.v.), including tree-worship and serpent-worship, are explicable only by the ghost-cult. On the other hand, ghost-worship is deeply influenced by magic (q.v.), especially in the evolution of the concept of the benignant ghost, to which allusion has already been made. Magic is, in its simplest terms, a means of control over supernatural powers. As the belief in magic increases, and as by implication its power increases, the ghost becomes less and less an object of fear, and in the same degree becomes more and more a beneficent spirit, until it is evolved in many instances into a guardian angel or some like concept. In this way the ghost idea may be traced from the primitive belief in life after the death-sleep, the care for such life and the avoidance of its ill will, the superhuman and generally malignant nature of that life, and its evanescence in the lapse of years, down to the benignant ghost, controlled at first by magic, which often acts as a guardian spirit, while the immortality concept, at first individual and temporary, finally becomes universal and eternal.

See also **DEMONOLOGY**; **ESCHATOLOGY**; **MAGIC**; **MORTUARY CUSTOMS**; **RELIGIONS, COMPARATIVE**; **SUPERSTITION**; **TOTEMISM**.

GHOSTS. One of the most thrilling and powerful of Ibsen's dramas (1881). It shows the consequences of inherited evil, the ghosts that return; and gives a gloomy picture of the inevitableness of fate. Oswald Alving, son of a vicious father, whose past had been concealed, after a struggle becomes a physical wreck, and at the close begs his mother to end his torture with poison.

GHURI, گھورے. A Mohammedan dynasty which received its name from Ghur, a district of Afghanistan. Ten monarchs are included in this line, and their power lasted from about A.D. 1148 to about A.D. 1215. In 1148 ALA UD-DIN HUSAIN and his brothers, SAIF UD-DIN SURI and BAHU UD-DIN SAM, attacked and captured Ghazni (see **GHAZNIVIDES**), which was placed under Saif ud-Din. This prince was defeated by Bahram, Shah of Ghazni, in the following year, and was hanged. He was succeeded by Bahu ud-Din as ruler of Ghur, who died within the year, and was followed in turn by Ala ud-Din, who again captured Ghazni. Imprisoned by Sanjar in 1150, Ala ud-Din was released after two years and died at Herat in 1156, being succeeded by his son, SAIF UD-DIN MOHAMMED, who was followed seven years later by his cousin, GHIYATH UD-DIN. In 1173 the most famous prince of the line, MOHAMMED GHURI, who was to be the conqueror of Northern India, captured Ghazni, which had been lost, and began his career as a warrior. He took Lahore from Khusrû Shah, the last of the Ghaznivides, in 1181, and captured it again five years later. Mohammed's early attempts to conquer India were not successful, and he was

severely defeated by the Rajah of Delhi and Ajmere, near Thaneswar, between Delhi and Ambala, in 1191. In the following year the tables were turned; the Rajah was defeated and captured near the scene of his previous victory, and put to death. In 1193 Delhi was captured, and the first, or Turkish, dynasty of Delhi Sultans was founded there by MOHAMMED GHURI. The Sultan continued his conquests, defeating the Maharajah of Kanouj in 1194, thus extending his dominion to Benares. Within ten years his slave, Qutb ud-Din, had reduced Gujarat, and Mohammed Bakhtyar had subdued Oudh, Behar, and Bengal. In 1206 Mohammed Ghuri, who kept his court at Ghazni in Afghanistan, was assassinated while asleep in his tent on the banks of the Indus, and was succeeded by his nephew, GHIYATH UD-DIN MAHMUD. As so often happened at the death of an Oriental conqueror, the Empire was broken up, and the dead Emperor's slave, QUTB UD-DIN, was crowned Emperor of Delhi at Lahore, and began a career of conquest, extending his sway to the Brahmaputra River. The reigns of the Ghuri dynasty after Mohammed, comprising GHIYATH UD-DIN MAHMUD (1206-10), BAHU UD-DIN SAN (1210), ALA UD-DIN UTSUZ (1210-15), and ALA UD-DIN MOHAMMED (1215), are entirely without interest.

GHYCZY, g'ŷel, KÁLMÁN (1808-88). An Hungarian statesman, born at Komorn. He was elected to the Diet in 1843, and in 1848 appointed Under-Secretary of State to Deák in the Ministry of Justice, succeeding him as Minister in September of that year. In 1861 he was elected a Deputy and became president of the House, and subsequently opposed the compromise of 1867 with Austria, but in 1874 accepted the appointment of Minister of Finance in the Bittó Ministry. He was again chosen president of the House of Deputies in 1875, but retired from public life in 1879.

GIACOMELLI, zhá'kó'mél'lé, HECTOR (1822—). A French illustrator, engraver, and painter, born in Paris. His best-known work is perhaps his series of initials and marginal drawings for the Doré Bible, and his illustrations for J. Michelet's *L'insecte* (1876). He published in 1862 *Raffet, son œuvre lithographique et ses eaux-fortes*.

GIACOMETTI, jà'kó-mét'té, PAOLO (1816-82). An Italian dramatist, born at Novi Ligure. He studied law in Genoa, but became a playwright and wrote altogether more than eighty works of various degrees of seriousness and literary value. For several years he was author to a strolling troupe of players, and under contract to supply yearly a fixed number of pieces to the impresario of the band. Many of these compositions were written in a few weeks' time during severe illness. His most important drama is the tragedy *Sofocle* (1860). He wrote also numerous feuilletons. His dramatic works appeared in selection at Milan (8 vols.) in 1859-66.

GIACOMOTTI, zhá'kó'mó'té, FÉLIX HENRI (1828—). A French historical painter, born at Quingey (Doubs). From 1850, and after studying at the Ecole des Beaux-Arts, he was a pupil of Picot. In 1854 he won the Prix de Rome. He returned to Paris in 1861. Besides religious and principally mythological subjects, both of which he treats with equal finish and grace—the latter often with a touch of sensuality—he also painted

excellent portraits. His principal works include: "The Rape of Amymone" (1855, Luxembourg Museum); "Agrippina Leaving the Roman Camp" (1864, Lille Museum); "Christ Blessing the Children" and "Christ in the Temple" (both in Saint-Etienne du Mont, Paris); "Apotheosis of Rubens and of Painting" (1878, ceiling-piece in the Luxembourg); "Centaur and Nymph" (1880); and "Lady Macbeth" (1886).

GIAFAR, jâ'fâr. The companion of Harun-al-Rashid, the Caliph of Bagdad, in the *Arabian Nights*. The nightly expeditions of these two characters about the city streets form the thread by which the various stories are connected. Giafar holds the Court office of Grand Vizier.

GIANIBELLI, jâ'nâ-bê'lê, or **GIAMBELLI**, FEDERIGO (c.1530-?). A famous military engineer. He was born at Mantua, and after serving for some time in Italy, proceeded to Spain and offered his services to Philip II.; but abruptly quitted Madrid, and after residing some time at Antwerp, where he acquired a high reputation as a mechanician, passed over to England and entered the service of Queen Elizabeth, who granted him a pension. During the War of Independence in the Netherlands, Alexander, Duke of Parma, generalissimo of the Spanish forces, laid siege to Antwerp in 1584, whereupon Elizabeth commissioned Gianibelli to proceed to the assistance of the inhabitants. On his arrival he found that the Spaniards had built a vast bridge across the Scheldt, interrupting all communication with the sea, by which alone the city could get provisions or help. Early in 1585 Gianibelli carried out a plan for blowing up the structure by floating down rafts laden with vast quantities of explosives against it, which were to be set off by means of a mechanical contrivance. The ponderous structure was partially blown into the air, and no less than 800 men—among whom were some of the best Spanish officers—were killed. This achievement, however, was rendered unavailing by the singular remissness displayed at this juncture by the defenders and by the wonderful energy of the Duke of Parma, as well as the want of unity among the citizens, and Gianibelli was obliged to return to England. Here he was employed at the time of the threatened Spanish invasion in fortifying the coast-line, which he did in a very skillful manner. When the Armada appeared in the Channel, it was Gianibelli who proposed and carried out the plan of sending fire-ships into the midst of the enemy, who remembered too well Gianibelli's 'Hell-burners' of Antwerp to await their coming, and fled. Gianibelli died probably in London. The date of his death is not known.

GIANNI, jân'nê, LAPO. An Italian poet of the thirteenth century, the friend and contemporary of Dante, who wrote a sonnet to him and Guido Cavalcanti. Nothing is known of his life. Of his verse there remain twelve ballate, two canzoni, and a doubtful sonnet. These are described by G. Tropic in *Rime di Lapo Gianni* (Rome, 1872). Rossetti also speaks of him in his *Dante and His Circle* (London, 1874).

GIANNONE, jân-nô'nâ, PIETRO (1676-1748). An eminent Italian historian, born May 7, 1676, at Ischitella, in the Neapolitan Province of Capitanata. He early distinguished himself as a lawyer at Naples, and soon accumulated sufficient means to enable him to devote considerable time and energy

to historical research. Early in life he had conceived the idea of writing a history of the Kingdom of Naples, and now in his villa adjoining Naples he labored for twenty years at this, his greatest historical work, which he published in 1723 in four volumes, under the title of *Storia civile del regno di Napoli*. This valuable and comprehensive work not only treats of the civil history of the kingdom, but also contains learned and critical dissertations on the laws and customs and the administrative history of Naples, from the most remote times, tracing the successive working of Greek, Roman, and Christian influences on the legislative and social institutions. His severe strictures on the spirit and practices of the modern Roman Catholic Church so enraged the ecclesiastical party that Giannone was denounced and anathematized by the Church. The fanaticism of the lower classes was aroused by the calumnies leveled at the writer, who was finally excommunicated by the Archbishop of Naples, and forced to take refuge first at Venice, and later at Vienna, and other places. His history was condemned as heretical and libelous by the Pope. Giannone, however, was granted a small pension by the Emperor Charles VI. In 1734 he was deprived of this income, and removed to Venice, whence he was expelled, and forced to seek shelter in Geneva. There he composed his famous diatribe, entitled *Il triregno*, against the Papal pretensions, and proclaimed his adoption of Calvinistic doctrines. Shortly after, an emissary from the Court of Turin induced Giannone to enter the Sardinian States, where he was immediately arrested, and conducted to the fortress of Turin. He passed the long years of his prison life in the pursuit of his chosen studies, and retracted his change of religious opinions, a step which in no way improved his condition. He died a prisoner in the fortress, March 7, 1748, after an incarceration of twelve years. His *Opere postume* (Lausanne, 1700), and his *Opere inedite*, edited by Mancini (Turin, 1859), complete the list of his historical works. An English translation of his *History of Naples* appeared in London (1729-31). Consult: Panzani, *Vita di Giannone* (Naples, 1821); Pierantoni, *Autobiografia di Pietro Giannone, i suoi tempi e la sua prigionia* (Rome, 1890).

GIANNOTTI, jâ-nôt'tê, DONATO (1494-1563). An Italian historian, born in Florence. The flight of Pietro de' Medici, after the victory of Charles VIII. of France (1494), brought a republican régime to Florence. In this atmosphere Giannotti grew up, and became secretary to the Council of Ten (1527). When Alessandro de' Medici returned (1530) he left Florence, and lived most of the remainder of his life in Venice, in the service of Cardinal Ridolfi, in France, attached to the suite of Cardinal de Tournon, and in Rome as secretary of briefs (1571), whither he had been invited by Pope Pius V. The most important of his works are: *Della repubblica de Veneziani* (1540); *Della repubblica fiorentina* (1721); and *Vita di Niccolò Capponi* (1620). His *Opere politiche e letterarie di Donato Giannotti* were published with a biography by Vannucci (Florence, 1850).

GIANOZZO MANETTI, jâ-nôt'sô mâ-nêt'tê (1396-1459). An Italian humanist, born at Florence. He was educated for commercial affairs, but from 1421 identified himself with the

literary life of the time, studying Greek under Ambrogio Traversari, and acquiring from a Jewish tutor, called Manuel, a knowledge of Hebrew then unusual. On many occasions he was employed on important State missions, particularly as Ambassador to the Courts of Venice, Naples, Rome, and other Italian governments. His fame as an orator was great, and in connection with his eloquence many marvelous stories are preserved. So influential did he at last become that Cosimo de' Medici thought it prudent by oppressive taxes to drive him from Florence. He was then attached to the service of Pope Nicolas V., and later of King Alfonso of Naples. His learning was very extensive, and in his endeavors to effect harmony between Christian traditions and those of the rediscovered classical world he became one of the foremost exponents of the new learning. He quite lacked, however, the literary art, with the result that his works are often verbose and platitudinous. Among his writings are translations into Latin of the ethical treatises of Aristotle, the Psalms, and the New Testament, and a lengthy polemic, *Contra Judæos et Gentes*.

GIANT DESPAIR. See DESPAIR, GIANT.

GIANT KILLER. See JACK THE GIANT KILLER.

GIANT or SPEAR LILY (*Doryanthes excelsa*).

An Australian plant of the order Amaryllidaceæ, with flowering stem ten to fourteen, sometimes twenty feet high, bearing at top a cluster of large crimson blossoms. The stem is leafy, with the largest leaves near the root. This plant is found both on the mountains and along the seacoast of New South Wales and Queensland. It is of splendid beauty. The fibre of its leaves has been found to be excellent for ropes. Other species, as *Doryanthes Palmeri* and *Doryanthes Guilfoylei*, are fibre plants of similar habit. They yield a large quantity of white elastic fibre, that is especially adapted to cordage, mats, etc. It has

GIANT LILY.

also been successfully used for making paper.

GIANTS (OF. *geant*, *jaiaint*, Fr. *géant*, from Gk. *γίγας*, *gigas*, giant). Adult human beings over normal size. In each race of mankind there is a standard of average height for men and for women, and this rule extends to castes and crafts as well as to civic and urban populations. This shows how much more powerful the race has become than the individual. Tall parents often have short children, and vice versa, but the breed is uniform. The following table will show the average stature of men among the so-called gigantic races:

Race	Height in inches
Scotch, of Galloway.....	71
Scotch in general.....	69.5

Race	Height in inches
Livonians.....	69
Irish.....	69
Norwegians.....	68.5
English.....	68
Polynesians.....	68-69
Sikhs, Punjab.....	68
Fulahs of Sudan.....	69
Kafirs.....	68
Cheyennes.....	69
Patagonians.....	69

Between the Akkas, a dwarfish negro people in the forests of Central Africa (height, 53 inches), and the Scotch farmers of Galloway, there is a difference of 18 inches, and this difference is about the same as that between the average height of the whole human race and the tallest giants.

The question is still mooted among ethnologists whether these differences in racial stature are due to nature or to nurture. Doubtless both causes have always been at work. It was believed among the ancients that the first men on the earth were tall and mighty, and that they degenerated both in vigor and longevity. In contrast with this is the attempt to prove that the first men were dwarfish, and that the modern races of short stature are only survivals of the first men living on the outskirts of civilization.

The term giant is applied also to abnormally tall individuals among the different peoples of the earth. Stories are common among the lower civilized peoples, as well as among savage tribes, to the effect that men have lived who measured 15 feet in height. Og, King of Bashan, is said in Deuteronomy (iii. 11) to have been the last of the giants. His bedstead of iron was 9 cubits, or between 11 and 13½ feet, in length. Pliny mentions the name of an Arabian giant who measured 9½ feet, and also speaks of two others who were 10 feet in stature. Allowance is to be made, as in all other cases, for the imagination of the narrator. The following list of men whose real height is well known shows that it is possible for individuals to go far beyond the average of the human species, which is 65 inches:

	Inches
Magrath, Bishop Berkeley's giant.....	92
Patrick Cotter (1761-1804) or O'Brien.....	99
Charles Byrne, Irish giant.....	100
Topinard's Kalmuck.....	100
Winkelmaier, Austrian (d. 1887).....	108
Topinard's Finlander.....	112

It is conceded on the part of medical men who have studied the subject with great care that men of extraordinary stature have feeble viability. Giantism is often associated with acromegaly (q.v.), but is most frequently produced by excessive growth. Bishop Berkeley's experiment is interesting in this connection, since the excessive height of the man was due to special feeding. Natural giants or dwarfs, however, are abnormal, accompanied with sterility and other weaknesses.

The word 'giant' does not always refer to persons of tall stature or large size; but in mythology and folk-lore the title is given to men of great strength, or speed, or prowess. It is these physical heroes that form the connecting link between the mythic world and the world of sense. It is only a short distance across a narrow boundary to the province of the Jotuns and Titans and other giants of the imagination. The Nephilim and Goliaths of the Bible are only a little way

from Heracles and Typhoeus. The Cyclops Polyphemus has his legendary parallels among all peoples.

It has been suggested that the old-time and still existing belief that mankind has degenerated, the excavation of great fossil bones in the superficial layers of the earth's crust, the discovery by explorers in the last four centuries of the taller races of the earth, whose height was exaggerated by the terrors of being in a strange country—all these combined to fix the belief in the real existence of gigantic races.

Giants in Greek mythology are variously conceived, either as the sons of Gæa, Earth (Hesiod), or as a wild race of aborigines of enormous stature and proportionate strength (Homer). But neither poet refers to that tremendous conflict between the giants and the gods which, though subsequent to the overthrow of the Titans by Zeus, was often confounded with it. Their mother Earth had made them proof against all weapons of the gods, and their final defeat was due to the prowess of a mortal, Heracles. They were struck down and buried under islands and mountains, especially volcanoes. The Enceladus and Typhoeus are associated with Etna. In the colossal sculptures of the altar at Pergamum, in Asia Minor, the greatest representation of the *Gigantomachia* in ancient times, the giants appear in various shapes, some human, some monstrous, snake-footed and winged.

The tradition about the Cyclops shows similarly diverse forms. The earliest legend makes them three in number, sons of Heaven and Earth, belonging to the race of the Titans, and yet helpers of Zeus in his struggle against their family. Each of them had one round eye in the centre of his forehead, and this element appears to be constant in the changing phases of the myth. In the *Odyssey*, however, they are gigantic and lawless shepherds living in Sicily, whose fertile soil produced for them of itself the fruits of the field. They were cannibals as well, and scoffers at Zeus. Polyphemus is described as the strongest among them, and loses his single eye in the encounter with Odysseus. Later they become the assistants of Vulcan at his forge under Etna, or on the Liparian Islands, and tradition ascribed to them the work, equally suitable to their great strength, of building the massive walls of Argos, Tiryns, and Mycenæ.

See further bibliography in the *Index Catalogue of the Surgeon-General's Library* (Washington), under "Dwarfs and Giants"; Tylor, *Early History of Mankind* (London, 1878); id., *Primitive Culture* (ib., 1891).

GIANTS, BATTLE OF THE. A term used of the Battle of Melegnano (Marignano), fought on September 13-14, 1515, between the allied French and Venetian armies and the Swiss allies of the Duke of Milan, in which the latter were defeated. The name originated with Trivulzio, who said that the eighteen battles which he witnessed were as child's play compared with this combat of the giants.

GIANT'S CAUSEWAY. A promontory on the coast of Antrim in the north of Ireland. A great outpouring of basalt took place here in the Tertiary period, and the edge of the intruded rock-masses was subsequently dissected by erosion, leaving a line of perpendicular cliffs, some of which are 500 feet high. Upon cooling the basalt assumed a columnar structure, to which is due the characteristic appearance of the Causeway. The close-fitting columns have geometrical outlines, usually hexagonal, and are divided into sections of equal length that articulate by means of convex and concave joints. The diameter of the columns ranges from 20 to 30 inches. The Causeway is divided into three portions, the Little Causeway, the Middle Causeway, and the Grand Causeway. The last has a width of from 60 to 120 feet, and extends out to sea for about 500 feet, forming a natural platform, which can be traversed on foot. Many of the neighboring cliffs exhibit the same columnar structure. One group of columns, from its peculiar arrangement, has been named the 'Saint's Organ.' There are many other interesting and picturesque localities in the vicinity, including the Amphitheatre, surrounded by cliffs 350 feet high, Chimney Point, a lofty mass of rocks, and Pleaskin Head. The castles of Dunseverick and Dunluce, now in ruins, are perched on the top of insulated crags.

GIANT'S DANCE. An old name (*Chorea gigantum*) for Stonehenge, suggested by a legend concerning that place, which was later superseded by a second tale, related by Geoffrey of Monmouth, causing the old name to fall into comparative disuse.

GIANTS' KETTLES. A popular name for deep cavities or pot-holes occurring in surface rocks. They are common in the glaciated regions of North America and Europe, especially on the coast of Norway, and are formed at the present time beneath the glaciers of the Alps. During the summer months the melting ice gives rise to glacial streams that run down the surface and escape into the crevasses. The erosive powers of the moving waters, carrying sand and stones, are directed by the ice-passages against the rocky floor, into which deep cavities are worn. The occurrence of giants' kettles in regions remote from glaciers is doubtless to be explained by a similar process of erosion operating during the Glacial period.

GIANTS OF GUILDHALL. See GOG AND MAGOG.

GIAOUR, jour. A Turkish word, corrupted from the Arabic *kafir* ('unbeliever'), and applied by the Turks to all who reject Mohammedanism, especially to European Christians. Though at first used exclusively as a term of reproach, its signification has been since modified, and now it is frequently employed merely as a distinctive epithet. Sultan Mahmud II. forbade his subjects to apply the term Giaour to any European.

GIAOUR, THE. A narrative poem by Lord Byron, published in May, 1813. Originally only 400 lines in length, it was enlarged the same year to 1400. It is a fragment of a Turkish tale of a slave, Leila, who was thrown into the sea. Her murder was avenged by her lover, a young Venetian, the Giaour of the title. It contains the well-known lines on Greece, beginning: "He who hath bent him o'er the dead."

THE GIANT'S CAUSEWAY
COUNTY ANTRIM, IRELAND

GIARRE, jár'rá. A rapidly growing city in Sicily, on the lower slopes of Mount Etna, three-quarters of a mile west of its port, Riposto, and 18 miles north of Catania (Map: Italy, K 10). The commercial importance of Giarre is due to its exquisite wines. Population of commune, in 1881, 20,751; in 1901, 26,000.

GIAVENO, já-vá'nò. A city in North Italy, on the left bank of the Sangone, 20 miles west of Turin (Map: Italy, B 2). It markets fruit, wine, potatoes, mushrooms, chestnuts, wood, and coal, and has cotton and jute factories. Population of commune, in 1881, 10,117; in 1901, 10,795.

GIB, gíb, ADAM (1714-88). A Scotch 'Anti-burgher' leader. He was born at Castletown, Perthshire, April 7, 1714. He entered the University of Edinburgh, and while still an undergraduate cast his lot with Ebenezer Erskine (q.v.) and others of the Secession Church. (See PRESBYTERIANISM.) He was licensed to preach in 1740, and the following year was ordained minister of the large Secession congregation of Bristo Street, Edinburgh, where he soon attained a position of prominence. In 1742 he caused some stir by the publication of an invective entitled *A Warning Against Countenancing the Ministrations of George Whitefield*; and in 1745 he was almost the only minister of Edinburgh who continued to preach against rebellion, while the troops of Charles Edward were in occupation of the town. When the dispute concerning the burgher's oath broke out in 1747 (see BURGHER AND ANTI-BURGHER), Gib became a leader of the minority in the 'Anti-burgher' synod. It was chiefly due to his influence that it was agreed by this ecclesiastical body to summon to the bar their 'Burgher' brethren, and finally to depose and excommunicate them for contumacy. From 1753 (when, after protracted litigation, he was compelled to leave the Bristo Street Church) till within a short period of his death, he preached regularly in Nicolson Street Church, which is said to have been filled every Sunday with an audience of 2000 persons. He died in Edinburgh, June 18, 1788. Among his works were: *The Present Truth, a Display of the Secession Testimony* (1774); and *Sacred Contemplations* (1786).

GIBARA, há-bá'rá. An important seaport town of Cuba, situated on the northern coast of the Province of Santiago de Cuba; about 25 miles north by east of Holguín, with which it is connected by rail (Map: Cuba, J 5). It has a fine harbor, protected by a fort at the entrance, and carries on a large trade in fruit, especially bananas, and corn. The vicinity produces also tobacco, sugar, and coffee, and is engaged to some extent in stock-raising. Timber is abundant in this region. The town has military and civil hospitals. Population, in 1899, 6841.

GIBBES, gíbz, ROBERT WILSON (1809-66). An American historian and scientist, born in Charleston, S. C. He graduated in 1827 at South Carolina College (Columbia), and in 1830 at the Medical College of South Carolina (Charleston), and from 1827 to 1835 was assistant professor of chemistry, geology, and mineralogy in the former institution. In 1852-60 he edited the *Weekly Banner* and the *Daily South Carolinian*, and twice he held office as Mayor of Columbia. During the Civil War he was surgeon-general of

South Carolina. At the burning of Columbia, in 1865, he lost valuable collections of minerals and fossils. In addition to many medical articles in various periodicals, of which that on "Typhoid Pneumonia" in the *American Journal of the Medical Sciences* (1842) may rank as most important, he published a *Documentary History of the American Revolution, Consisting of Letters and Papers Relating to the Contest for Liberty, Chiefly in South Carolina* (3 vols., 1853).

GIB'BET. A highwayman in Farquhar's *Beaus' Stratagem*, who claims that he is the best-behaved man in his profession.

GIBBIE, gíb'bl, GOOSE. A half-witted boy, a servant of Lady Bellenden, in Scott's *Old Mortality*.

GIBBON, gíb'bón (Fr., of unknown origin). An East Indian anthropoid ape of the subfamily Hylobatinae, the lower of the two divisions of the Simiidae, the other being the Simiinae, including the gorillas, orangs, and chimpanzees. The gibbons are of a smaller size and more slender form than the simians, and their arms are so long as almost to reach the ground when the animal stands in an erect posture; there are also naked callosities on the buttocks. The head is well formed, while the lower jaw is remarkable for the great development of the chin. The canine teeth are long. The gibbons are inhabitants of forests, their long arms enabling them to swing themselves from bough to bough, which they do to wonderful distances, and with extreme agility. They cannot move with ease or great rapidity on the ground, yet when they make the attempt they walk more uprightly than any other ape, stretching out their arms on each side to balance themselves, with the hands hanging from the wrist. They never creep on all fours; and they sleep at night curled up in a ball. In captivity they display gentleness and a high degree of teachability, and learn to eat all sorts of cooked food, though their natural diet consists mainly of fruit and birds. They have various loud cries, expressive of different emotions.

There are two genera, *Hylobates*, with seven or eight species, and *Siamanga*, containing only one, the *siamang* (q.v.), which differs from the type in having the first and second digits of the hind foot united as far as the second joint. None of the gibbons is of large size. The common, or lar gibbon (*Hylobates lar*), black, with a border of gray hair around the face, is found in some parts of India and in more eastern regions. The white-handed gibbon (*Hylobates albimana*), black, the face bordered with gray, and the four hands white, is a native of Sumatra. The active, or long-armed gibbon (*Hylobates agilis*), found in Sumatra, is particularly remarkable for the power which it displays of flinging itself from one tree to another, clearing at once, it is said, a distance of forty feet. The wow-wow (*Hylobates leuciscus*) is a gibbon found in Java. The hoolock (*Hylobates hoolock*) is a native of the northeastern part of India and the neighbor-

DENTITION OF A GIBBON.

Teeth of upper and lower jaws, left side: l, incisors; c, canines; p, premolars; m, molars.

ing parts of Assam. The fossil genus *Pithecanthropus* (q.v.) had much resemblance to gibbons.

Consult: Hartmann, *Anthropoid Apes* (London and New York, 1886); Haeckel, *Aus Insulinde* (Bonn, 1901). See APE; HOOLLOCK; SIAMANG; and Plate of ANTHROPOID APES.

GIBBON, EDWARD (1737-94). The historian of the Roman Empire, eldest son of Edward Gibbon and Judith Porten. He was born at Putney on the Thames, April 27 (O. S.), 1737. Of his five brothers and one sister none survived infancy. The story of his life Gibbon told in his autobiography, published after his death under the title, *Memoirs of My Life and Writings* (1796). Like most thinkers, his actions are inseparable from his thoughts and the growth of his mind. He spent a sickly childhood in occasional lessons and desultory reading and discussion with his mother's sister, a woman of strong understanding and warm heart, whom he calls 'the mother of my mind,' and to whose kindness he ascribes not only the bringing out of his intellectual faculties, but the preservation of his life, in these critical early years. Though his education was interrupted by illness, he read enormously. From various tutors and schools he passed to Magdalen College, Oxford (1752). Here he spent fourteen idle months, the chief result of which was that in his incursions into controversial theology he became a convert to the Catholic Church, and found himself shut out from Oxford. His father then placed him under the care of David Mallet, poet and deist, by whose philosophy Gibbon was 'rather scandalized than reclaimed.' He was then sent to Lausanne, in Switzerland, to board in the house of M. Pavilliard, a Calvinist minister, who judiciously suggested books and arguments to the young Gibbon, and had the satisfaction of seeing him reconverted to Protestantism in the course of eighteen months (1754). Subsequently his mature meditations led him away from all religions. With M. Pavilliard, whom he greatly respected, he lived for nearly five years. It was here that he began and carried out those private studies which, aided by his enormous memory, made him a master of erudition without a superior, and with hardly an equal. Here, also, he fell in love with Susanne Curchod, the beautiful and accomplished daughter of a humble minister at Crassy, who afterwards became Madame Necker, the mother of Madame de Staël. Gibbon's father disapproved of this 'strange alliance,' and Gibbon yielded to his fate.

Returning to England in 1758, he continued his studies with some interruptions. At the request of his father he finished a little work in French, begun at Lausanne, and published it under the title, *Essai sur l'étude de la littérature* (1761). In 1759 he became a captain in the Hampshire militia, and afterwards major and colonel. The militia being disbanded, he revisited the Continent, crossing the Alps and going on to Rome, where first came to him the thought of his great work. His plan, originally circumscribed to the decay of the city, grew, by years of reading and reflection and delay, to embrace the Empire. On the death of his father (1770), Gibbon came into possession of a comfortable fortune, settled in London (1772), and at once began writing the *Decline and Fall of the Roman Empire*. In 1774 he joined the famous

Literary Club of Dr. Johnson, and entered Parliament, where he sat 'a mute' for eight years. In 1776 the first volume of the *History* was published, and its success was immediate. Indeed, the reputation of the author was established before the religious world had time to consider and attack the famous fifteenth and sixteenth chapters, in which, while admitting, or, at least, not denying, the "convincing evidence of the doctrine itself," and "the ruling providence of its great Author," Gibbon proceeds to account for the rapid growth of the early Christian Church by 'secondary,' or human causes. He proceeded with the history, publishing two more volumes in 1781. Two years later he returned to Lausanne, where the great work was completed. The last three volumes were published in 1788. In 1793 he returned to England to visit his friend Lord Sheffield, whose wife had just died. While in London Gibbon died, January 16, 1794, and was buried among the Sheffield's in the church at Fletching in Sussex. Under the direction of the Royal Historical Society, the centenary of his death was commemorated in London, November, 1894.

It is not easy to characterize, in a few or in many phrases, a man of so gigantic and cultivated an intellect. The *Decline and Fall* is one of the greatest achievements of human thought and erudition. It is virtually a history of the civilized world for thirteen centuries, during which paganism was breaking down and Christianity was taking its place. The new facts which have come to light since Gibbon's time have shown that he was mistaken on many points; but the truth of his picture in the main has never been successfully impeached. The work also possesses style. No one to-day would imitate, if he could, the balanced structure of Gibbon's sentences. But in Gibbon, as in the Elizabethan writers, the charm lies precisely in this stately march of phrase and sentence. Byron rightly called Gibbon 'the lord of irony.' Of this characteristic of his genius, which gives piquancy to his style, the historian himself was aware; and he claimed to have learned it from Pascal, whose *Provincial Letters* he read almost every year. After all, Gibbon is at his best where he is most himself, as in the dignity and measured melancholy of his autobiography.

Lord Sheffield published Gibbon's *Miscellaneous Works* (2 vols., 1796; 5 vols., 1814). The autobiography contained therein was pieced together from six different manuscripts, with omissions and some additions. These six manuscripts have been published by a grandson of the elder Lord Sheffield (London, 1896). Excellent editions of the *Memoirs* have also been edited by Emerson (Boston, 1898), and by Hill (London, 1900). All editions of the *Decline and Fall* have been superseded by that of Bury (7 vols., London, 1896-1900). Consult also *The Letters of Gibbon*, edited by Prothero (London, 1896).

GIBBON, JOHN (1827-96). An American soldier. He was born in Holmesburg, Pa.; graduated at West Point in 1847, served in the Mexican War, at the City of Mexico and Toluca, in 1847-48, and was assistant instructor of artillery at West Point from 1854 to 1857, and quartermaster there from 1856 to 1859. During the Civil War he was chief of artillery in General McDowell's division from October, 1861, to May,

1862; was promoted from the rank of captain in the Regular Army to that of brigadier-general of volunteers on May 2, 1862; participated in the second battle of Bull Run and in the battles of South Mountain and Antietam; commanded a division in the Army of the Potomac during the Rappahannock campaign, from November, 1862, to June, 1863, being wounded at Fredericksburg on December 13, 1862; commanded the Second Army Corps in the battle of Gettysburg, where he was seriously wounded, and subsequently served for part of the time as commander of the Twenty-fourth Corps, in the final campaign of General Grant, which ended with the surrender of General Lee at Appomattox on April 9, 1865. On June 7, 1864, he became major-general of volunteers, and on March 13, 1865, was brevetted brigadier-general and major-general in the Regular Army. Mustered out of the volunteer service in January, 1866, he reentered the Regular Army as colonel in July, commanded successively several Western posts, was wounded in the engagement of Big Hole Pass, Mont., with the Nez Percés Indians on August 9, 1877, and commanded successively the departments of Dakota, of the Platte, of the Columbia, and of California. On July 10, 1885, he was promoted to the regular rank of brigadier-general, and in 1891 he was retired from active service. Besides a number of magazine articles, he published *The Artillerist's Manual* (1859).

GIBBONS, gib'bonz, ABIGAIL (HOPPER) (1801-93). An American philanthropist, daughter of Isaac T. Hopper (q.v.). She was born in Philadelphia, taught school there and in New York, and in 1833 married James Sloan Gibbons. She greatly assisted her father in the formation of the Women's Prison Association and of the Isaac T. Hopper Home for discharged prisoners. During the Civil War she rendered valuable service in the Federal camps and hospitals. Both she and her husband were widely known as abolitionists, and in the draft riots of July, 1863, their house in New York was one of the first to be sacked. Consult her *Life*, by her daughter, S. H. Emerson (New York, 1897).

GIBBONS, CHARLES (1814-85). An American lawyer, born in Wilmington, Del. After legal study in Philadelphia in the office of Charles Chauncey, he was admitted to the bar in 1838, and for a number of years was a member of the State Senate, of which he served as president in 1847. He was a founder of the Union League, whose constitution he formulated, was chairman of the first Republican State Committee, and during the Civil War represented the United States Government on a special commission for the argument of prize cases in the Federal courts of Philadelphia.

GIBBONS, GRINLING (1648-1721). An English sculptor and wood-carver. He was born at Rotterdam April 4, 1648, and was of Dutch extraction, as is proved by his letters. He attracted the attention of Evelyn (q.v.), the diarist, who introduced him to Charles II. He was master carver in wood to the Crown from Charles II. to George I. His first important group in wood was a "Crucifixion," after Tintoretto's famous picture, which was followed by his "Stoning of Saint Stephen," for the King. Gibbons was much employed by Sir Christopher Wren (q.v.) in his churches, for whom he carved the choir

stalls of Saint Paul, and the woodwork of Trinity College, Cambridge. He executed many carvings for the King in the palaces of Windsor, Whitehall, and Kensington, and his work was found in nearly all the mansions of the nobility built during this period; particularly important is the carving at Chatsworth, made for the Duke of Devonshire. He also essayed sculpture in bronze and marble, but not with the same success, as is shown by his marble statues of Charles II. in the Royal Exchange and Chelsea Hospital, and by the bronze statue of James II. at Whitehall. He employed a large number of assistants, and his work is particularly famous for the splendid groups of flowers, fruit, game, etc., in life size, and very true to nature.

GIBBONS, JAMES (1834-). An American Roman Catholic prelate and cardinal. He was born in Baltimore July 23, 1834, and received his early education in Ireland, the former home of his family, to which he was taken in infancy. Returning to Maryland at the age of seventeen, he pursued his studies for the priesthood at Saint Charles's College and Saint Mary's Seminary. He was ordained in 1861, and after a few months of service at Saint Patrick's, Baltimore, was placed in charge of Saint Bridget's Church, Canton, just outside the city. Archbishop Spaulding soon discerned his gifts, and brought him to the cathedral as secretary, and soon as chancellor. In 1868 he was made Vicar Apostolic of North Carolina, and to fulfill the duties of the office he was consecrated bishop. His successful administration of this difficult work earned him promotion in 1872 to the See of Richmond, Va., and his five years there were also marked by notable development of the Church's activity in many directions. In 1877 he was appointed coadjutor with right of succession to Archbishop Bailey of Baltimore, then in failing health, and later in the same year succeeded to the dignity of Primate of the United States, which is annexed to the See of Baltimore as the earliest in foundation. In right of this office he presided over the important deliberations of the Third Plenary Council of Baltimore in 1884, whose successful issue was largely due to him. In recognition of all these services, as well as of the growing importance of the American branch of the Church, he was created a cardinal by Leo XIII. in 1886; but his elevation made no difference in the simple, unostentatious kindness which had long endeared him to all who knew him, without as well as within his own communion. Because of his advanced age, at his own request, Bishop Curtis, formerly of Wilmington, Del., was appointed to assist him in 1896. His best-known work is *The Faith of Our Fathers* (1871), an admirable popular exposition of the Roman Catholic doctrines; others are: *Our Christian Heritage* (1889) and *The Ambassador of Christ* (1896).

GIBBONS, JAMES SLOAN (1810-92). An American author and philanthropist, born in Wilmington, Del. From 1835 he was active in New York City as a banker and a writer on financial subjects. He became the friend of Wendell Phillips, William Lloyd Garrison, and other notable abolitionists, and rendered much aid to their cause. In 1863 his house in New York City was sacked on account of its illumination in honor of the Emancipation Proclamation.

In 1862 he published in the New York *Evening Post* his famous war song, "We are coming, Father Abraham, three hundred thousand strong." He also began the movement toward the preservation of forests in the United States. He wrote *The Banks of New York* (1838); *The Public Debt of the United States*, (1867); and other works.

GIBBONS, ORLANDO (1583-1625). A celebrated English organist and composer. In his boyhood he served as a chorister at King's College, Cambridge, and in 1604 was appointed organist of the Chapel Royal. He is one of the most important composers in the history and evolution of English music, his services and anthems still being regularly sung in all the cathedrals and important churches of Great Britain. His compositions were the earliest engraved musical works in England. His madrigals, "Dainty Sweet Bird," and "The Silver Swan," are among the best of their kind, and have always been popular; while the anthems, "Hosannah to the Son of David," "Almighty and Everlasting God," and "O Clap Your Hands Together," are reckoned masterpieces of scientific writing in the fugue form, combined with exquisite melody. He died of smallpox, caught while taking part in the marriage services of Charles I., for which ceremony he had composed the music. His two brothers, **EDWARD** (c.1570-c.1650), organist of Bristol Cathedral, and **ELLIS** (?-c.1650), organist of Salisbury Cathedral, were also musicians of wide repute; and his son, **CHRISTOPHER GIBBONS** (1615-76), was appointed organist to the King (Charles II.) and also of Westminster Abbey.

GIBBONS, WILLIAM (1781-1845). An American physician. He was born in Westtown, Pa., graduated at the University of Pennsylvania in 1805, and settled in Wilmington, Del., where he practiced as a physician until his death. He devoted much of his time to the study of the natural sciences and to philological studies, and was a promoter of the Delaware Academy of Natural Science and the first president of that institution. He was a zealous member of the Society of Friends, and is remembered as the author of a tract entitled *Truth Vindicated*, in which he explains and vigorously defends the doctrines of the Society.

GIBBOSITY, gib-bôs'î-tî (from *gibbous*, from Lat. *gibbosus*, humped, from *gibbus*, hump). A variety of outline in which there is a convexity. The moon is gibbous between the half and the full moon. Medically the term is used in describing a protuberance of a part of the body; chiefly applied to humpback or other distortions depending on disease of the spinal column. See **POTT'S DISEASE**; **RICKETS**.

GIBBS, gibz, ALFRED (1823-68). An American soldier, born in Sunswick, Long Island. He graduated at West Point in 1846, served as second lieutenant in the Southern campaign under Scott during the Mexican War, and was brevetted first lieutenant and captain. From 1848 to 1856 he was aide-de-camp to Gen. Persifor F. Smith in Mexico, Texas, New Mexico, and California; was wounded in an engagement with the Apache Indians at Cooke's Spring, N. M., on March 8, 1857; and from 1858 to 1860 was employed in the recruiting service. On May 13, 1861, he became

captain. He was captured by a Texan force on July 8, 1861, was paroled, and was not exchanged until August 27, 1862. Subsequently he took an active part in various cavalry operations in Virginia, particularly under Sheridan in the Shenandoah Valley, was promoted to be brigadier-general of volunteers in October, 1864, and commanded a cavalry brigade in Grant's final campaign against Lee. On March 13, 1865, he was brevetted colonel and brigadier-general and major-general in the Regular Army, as well as major-general of volunteers. He was mustered out of the volunteer service on February 1, 1866, and thereafter until his death at Fort Leavenworth, Kan., was on frontier duty at various Western posts.

GIBBS, GEORGE (1766-1833). An American mineralogist, born at Newport, R. I. He made a collection of minerals containing ten thousand specimens purchased in Europe and more than that number collected by himself. This cabinet, the largest and most important in the United States at that time, was sold to Yale for \$20,000, the funds having been raised largely through the instrumentality of Professor Benjamin Silliman (q.v.). Gibbs published scientific articles in the *American Journal of Science* and the *American Mineralogical Journal*, and in 1822 was elected vice-president of the Lyceum of Natural History at New York.

GIBBS, JOSIAH WILLARD (1790-1861). An American philologist. He was born at Salem, Mass.; graduated at Yale in 1809, and was a tutor there from 1811 to 1815. In 1824 he became professor of sacred literature, an appointment which he held until his death. Among his publications are: A translation of Storr's *Essay on the Historical Sense of the New Testament* (1817); a translation of Gesenius's *Hebrew Lexicon of the Old Testament* (1824); and *Philological Studies* (1857). He was a contributor to Prof. William C. Fowler's *English Language in Its Elements and Its Forms* (1850); and to Webster's *Unabridged Dictionary*.

GIBBS, JOSIAH WILLARD (1839-1903). An American physicist, born at New Haven, Conn. He graduated at Yale in 1858, studied also in Paris, Berlin, and Heidelberg, and in 1871 was appointed professor of mathematical physics at Yale. He was elected a member of the National Academy of Sciences, and of the Royal Society of London. His writings include numerous papers on mathematical physics, in particular on thermodynamics, such as "Graphic Methods in the Thermodynamics of Fluids," and "Method of Geometrical Representation of the Thermodynamic Properties by Means of Surfaces" (1873), both published in the *Transactions of the Connecticut Academy of Arts and Sciences*.

GIBBS, WOLCOTT (1822-). A distinguished American chemist. He was born in New York City; graduated at Columbia in 1841, and at the College of Physicians and Surgeons in 1847, and subsequently studied medicine and the physical sciences in Germany. In 1863 he became professor at Harvard, and lectured on science as applied to the useful arts. During the Civil War he was an active member of the Sanitary Commission, and in 1873 went as one of the commissioners to the Vienna Exposition. He is the author of many papers on chemical science in the

American Journal of Science. He was president of the National Academy of Sciences in 1895. Dr. Gibbs carried out a large number of original investigations in physics and chemistry, which have rendered his name famous. His researches on vapor-densities, on the platinum metals, and on the ammonia-cobalt bases were of particular importance.

GIBEAH, gîb'ê-â (Heb., *Gîb'ah*, hill). The name of several places in ancient Palestine, the chief of which was Gibeah of Benjamin, called also Gibeah of Saul. It was north of Jerusalem and south of Rameh, and was the scene of the story of the Levite and his concubine (Judges xix.-xxi.). At various times in the struggles with the Philistines Gibeah became an important strategic point. It was the home of Saul, and probably his birthplace (I. Sam. x. 26). In the days of David two sons and five grandsons of Saul are said to have been executed here in revenge for a slaughter of the Gibeonites by Saul (II. Sam. xxi. 1-9). The narrative of Saul's reign gives no account of such an event. Gibeah of Benjamin has been identified with the modern village of Tuleil or Tell el-Ful, about four miles north of Jerusalem.

GIBEL, gîb'el (Ger., sort of chub, Fr. *gibel*; possibly connected with Ger. *Giebel*, gable, OHG. *gebal*, head, *gibilla*, skull, Gk. κεφαλή, *kephalē*, head), or **PRUSSIAN CARP**. A small carp (*Cyprius gibelio*) without barbels, common in some parts of Continental Europe and in England. It differs from the crucian in having a forked tail, and is an excellent table fish. See **CARP**.

GIBEON, gîb'ê-on (Heb. *Gîb'on*, hilly). An ancient city of Palestine, northwest of Jerusalem, at the time of the conquest by the Israelites, inhabited by the Hivites (Joshua ix. 3, 7). By means of a stratagem the Gibeonites secured a promise of friendship from Joshua. The deceit was afterwards discovered, but the letter of the promise was kept, the Gibeonites being condemned to be 'hewers of wood and drawers of water for the congregation,' and when the five kings of the Amorites attacked Gibeon, Joshua went to its assistance (Joshua ix. 3-x. 7). It was during the battle fought on this occasion that "the sun stood still and the moon stayed, until the people had avenged themselves upon their enemies" (Joshua x. 8-14). Saul almost exterminated the Gibeonites (II. Sam. xxi. 1-5). Gibeon was the scene of a battle between David's forces and those of Ishbosheth (II. Sam. ii. 12-32), and at 'the great stone which is in Gibeon' David's general, Joab, treacherously slew the other general, Amasa (II. Sam. xx. 4-10). The city had its chief importance as the seat of a *bamah*, or high place, called in I. Kings iii. 4 'the great high place.' At the beginning of his reign Solomon sacrificed there a thousand burnt offerings with great ceremony, and Yahweh appeared to him in a dream by night (I. Kings iii. 4-15). Gibeon is identified with the modern village of el-Jib, about five miles northwest of Jerusalem.

GIBRALTAR, jîb-râ'l'târ, *Sp. pron.* hê-brâl-tîl'r. A town and fortress on the rocky promontory of Gibraltar, forming the eastern horn of the Bay of Algeiras, or Gibraltar, on the south coast of Andalusia, Spain, at the eastern end of the Strait of Gibraltar, at the entrance to the

Mediterranean (Map: Spain, C 4). Since 1704 it has been a Crown colony of Great Britain, under the administration of a governor. It stands opposite the Spanish town of Algeiras, six miles distant on the west side of the bay, with which it has steam-ferry communication several times daily. Owing to its important strategical position, it is called the 'Key of the Mediterranean.' The sandy isthmus connecting the promontory with the mainland is neutral territory; it lies so low that from the sea Gibraltar has the appearance of an islet. The Spanish town of La Línea de la Concepción, practically a suburb of Gibraltar, on the mainland, fronts the isthmus and the neutral ground, the Spanish boundary being marked by a double line of sentry-boxes. The population of La Línea in 1901 was 31,862, 10,000 of whom, it was estimated, formed the daily laboring class of Gibraltar. The promontory, or 'Rock of Gibraltar,' composed of gray primary marble, is in the form of an 'enormous lion'; it is nearly three miles long, with an average width of about three-quarters of a mile, and attains an altitude of 1439 feet. Although it has a barren and uninviting aspect, aloes, cacti, palmitas, capers, and asparagus grow in the crevices; and there are grassy, wooded glens in certain parts, where partridges, pigeons, wood-cocks, and fawn-colored Barbary apes are to be found. There are several natural caves in the rock, of which Saint Michael's, with an entrance 1100 feet above the sea, is the largest. The north, east, and south sides of the promontory are so steep and precipitous as to be almost inaccessible; the north and northwest sides are honeycombed by fortified artificial galleries. The town and fine modern harbor on the west are protected by a sea wall with bastions, and by batteries and forts rising from the base to the summit of the rock. Modern guns of the most formidable pattern have replaced the old armaments.

The town, divided by the Alameda Park into two parts, although irregularly laid out, contains several fine public buildings. The houses are built in terraces, and for the most part are of Spanish architecture. There are an Anglican cathedral, four Roman Catholic churches, and hospitals. The water-supply depends on the rainfall, which is stored in a system of huge tanks. The climate is the warmest in Europe, but is healthful, the former unsanitary conditions having been removed by modern methods. The colony is self-supporting, but the garrison is maintained by the British Government. Gibraltar is a free port, and an important coaling station. The shipping of the port exceeds 4,000,000 tons annually, and is mostly in British bottoms. The legal currency is British, but Spanish money is also in circulation. The population, including the garrison of 5349 men, in 1901, was 27,460, consisting mostly of Britons, Spaniards, Jews, and Moors.

Gibraltar (the Phœnician *Alube* and Greek *Calpe*) and Abyla (the Sierra Bullones near Ceuta, Morocco) are the classical 'Pillars of Hercules,' which were crowned by silver columns erected by the Phœnician mariners to mark the limits of navigation. After 711 the rock was named Jebel-al-Tarik (Hill of Tarik, whence its modern name), after the Arab chief Tarik ibn Ziad, who built a fortress on the promontory, part of which still exists. In 1309 Gibraltar was

taken by the Castilians, but was regained by the Moors in 1333, and held until 1462, when it finally passed from their possession. After the sacking of Gibraltar by Barbarossa, the Algerine, in 1540, extensive works were built by command of Charles V. In 1704 it was captured by a combined Dutch and English force under Sir George Rooke and the Prince of Hesse-Darmstadt, fighting for the Archduke Charles of Austria; but it was unscrupulously taken possession of for the Crown of England by the British admiral. The most important event in its subsequent history is the famous siege of three years, seven months, and twelve days, extending from 1779 to 1783, which bristled with exciting incidents. Communications with Spain were closed on June 21, 1779, and a strict blockade was established by the Spanish fleet; the strength of the besieged force at this period was 5382 men, under General Elliott, the Governor. Twice the garrison was almost reduced to starvation, being temporarily relieved in the face of great opposition, on the first occasion by Admiral Rodney, who added 1000 to the defenders, and on the second occasion by Admiral Darby. In July, 1782, the Duc de Crillon took command of the combined naval and land forces of France and Spain employed in the siege, and made preparations for a supreme effort. Additional batteries were constructed on the land side, and ten enormous and presumed invincible floating batteries were constructed by the Chevalier d'Arçon. Covered boats to disembark 40,000 troops were also prepared. The formidable attack commenced on September 8, and continued until the 13th, when, by the expedient of red-hot balls, the British destroyed the floating batteries and repulsed their enemies, of whom over 2000 were killed. The British casualties were 16 killed and 68 wounded. The signing of the preliminaries of peace put an end to the siege in February, 1783. Consult: Drinkwater, *History of the Siege of Gibraltar* (London, 1785; new ed. 1844); Mann, *History of Gibraltar* (London, 1870); Field, *Gibraltar* (New York, 1889).

GIBRALTAR, STRAIT OF (Lat. *Fretum Herculeum*). A narrow passage connecting the Atlantic Ocean with the Mediterranean Sea, and separating Spain from Morocco (Map: Europe, C 5). Its length is about 36 miles, and its width varies from about 9 miles at the western entrance to about 13 miles at the eastern entrance. The depth averages about 900 feet. A continual central current enters from the Atlantic, and tidal currents ebb and flow along the European and African shores. It is supposed that the surplus waters of the Mediterranean are carried off by an under-current in the strait, as well as by evaporation.

GIBRALTAR OF AMERICA. A frequent name for Quebec, because of its position and strong fortifications.

GIBSON, gib'son, CHARLES DANA (1867—). An American illustrator. He was born at Roxbury, Mass., September 14, 1867. The first eight years of his life were spent in Boston. Later his home was in Flushing, Long Island. He was a student at the Art Students' League, New York. In 1886 he made his debut as an artist for the periodicals. In 1889 he went to Paris, and was enrolled at Julien's studio. Returning to New York, he was active as an illustrator. In 1893-

94 he was again in Paris; in 1895-96, in London; in 1898, in Munich.

His subjects are taken from the boulevards, byways, theatres, clubs, law courts, music halls, parks, and crowds in stations. His most popular works are society cartoons. He is a skillful draughtsman, making his lines characterize the person or object with the greatest simplicity. Gibson is one of the most successful artists in New York City. His published works include: *London, as Seen by C. D. Gibson* (1895-96); *Pictures of People* (1896); *People of Dickens* (1897); *Sketches and Cartoons* (1898); *The Education of Mr. Pipp* (1899); *Americans* (1900); *A Widow and Her Friends* (1901); *The Social Ladder* (1902). He created the type of woman known as the 'Gibson girl.'

GIBSON, EDMUND (1669-1748), Bishop of London, and an authority upon canon law. He was born in 1669; entered Queen's College, Oxford, in 1686; and in 1692 published an edition of the *Saxon Chronicle*, with a Latin translation, indices, and notes. This was followed in 1693 by an annotated edition of the *De Institutione Oratoria* of Quintilian, and in 1695 by a translation of Camden's *Britannia*, 'with additions and improvements,' in the preparation of which he had the assistance of several other scholars. The year preceding he had taken holy orders, and became chaplain and librarian to Thomas Tenison, Archbishop of Canterbury. In 1703 he became rector of Lambeth, and in 1710 Archdeacon of Surrey. In the discussions which arose in the reigns of William and Anne relative to the rights and privileges of the Convocation, Gibson took a very active part, and in a series of pamphlets warmly advocated the right of the Archbishop to continue or prorogue that assembly. The controversy suggested to him the idea of those researches which resulted in the *Codex Juris Ecclesiæ Anglicanæ*. In 1716 Gibson was consecrated Bishop of Lincoln, whence he was, in 1723, translated to London, where for twenty-five years he exercised an immense influence, being the authority chiefly consulted by the Court on all ecclesiastical affairs. Among the literary efforts of his later years, the principal were a series of *Pastoral Letters*, and the *Preservative Against Popery* (1738), a compilation of numerous controversial writings of eminent Church of England divines, dating chiefly from the period of James II. He died at Bath, September 6, 1748.

GIBSON, JOHN (1790-1866). An English sculptor. He was born at Gyffin, near Conway, North Wales, and at an early age was apprenticed to a cabinet-maker in Liverpool. When sixteen years old he was employed in the marble-works of Francis, at Liverpool, where his talents gained him the patronage of William Roscoe, who not only became his friend, but also secured him pecuniary aid. In 1817 he made his way to London, and in the same year he went to Rome, bearing a letter of introduction from Lord Brougham to Canova. He entered the atelier of Canova, and remained in Rome twenty-seven years, executing in that city most of his important works. He occasionally returned to England to superintend the placing of his statues, and on these occasions was received with enthusiasm, and every attention paid him.

In 1819 he executed his first commission, a

ROCK OF GIBRALTAR

group of "Mars and Cupid," for the Duke of Devonshire, now at Chatsworth. Under the influence of Canova and Thorwaldsen, his work became thoroughly classic, and he excelled in portraying ideal Greek subjects of youthful beauty. Among the most famous of these are the "Psyche Borne by Zephyrs" (1821) and "Hylos Surprised by Nymphs" (1826), both in the National Gallery, London; and especially his statue of "Venus with the Turtle," one of his latest works, which he himself considered his best. In this statue he made use of the polychromy of the Greeks, as he conceived it. He was so thoroughly wedded to Greek art that when commissioned to make a portrait statue of Queen Victoria he would do it in no other wise than represent her in classical draperies and with sandals. In the Palace of Westminster he carved the group in which the Queen is represented leading the allegorical figures of "Clemency" and "Justice." The only religious subject he portrayed was "Christ Blessing the Little Children." His best work in the round was the "Hunter and Dog." His classical tendencies interfered with his success in portrait statues. Among the best known of these are the colossal statue of Huskisson (1844), in Liverpool, and two other statues of the same statesman; Sir Robert Peel, in Westminster Abbey; and George Stephenson, in Liverpool. Gibson was a man of kindly life and character, and notoriously absent-minded. His only pupil and most intimate friend was Harriet Hosmer, the American sculptress. He died in Rome, January 27, 1866. Consult his *Life*, by Lady Eastlake (London, 1869), which also contains his autobiography.

GIBSON, JOHN MONRO (1838—). A Scottish clergyman of the Presbyterian Church, born at Whithorn, Wigtownshire. He went to Canada in 1855; graduated in 1862 at Toronto University, and in 1864 at Knox College (theological), Toronto; and in 1864-74 was pastor of the Erskine Church, Montreal. From 1868 to 1874 he was also lecturer in Hebrew and Greek exegesis at Montreal Theological College. He was pastor of the Second Presbyterian Church, Chicago, in 1874-80, and in the latter year became pastor of the Saint John's Wood Presbyterian Church, London, England. In 1891 he was elected moderator of the Presbyterian Council of Free Churches. His publications include: *The Ages Before Moses* (1879); *The Foundations* (1880); *The Gospel of Matthew* (1890), in the "Expositor's Bible Series"; *The Unity and Symmetry of the Bible* (1896); *From Fact to Faith* (1898); and *The Glory of Life* (1900).

GIBSON, JOHN MORISON (1842—). A Canadian official. He was born near Toronto, and was educated in Hamilton and at the Toronto University, where he took a law course. In 1889 he was elected Provincial Secretary, and in 1890 he was appointed a Queen's counsel. He became widely known because of his active interest in educational and military matters, was appointed lieutenant-colonel of volunteers, and did much to increase the efficiency of his regiment.

GIBSON, RANDALL LEE (1830-93). An American soldier and legislator. He was born at Spring Hill, Ky.; graduated at Yale in 1853, and afterwards studied law at the University of Louisiana (now Tulane University). After having been admitted to the bar, he went to

Europe, where he studied at Berlin and Madrid, and was attached to the American Legation at the latter place. In 1856 he returned to Louisiana, where he was engaged in sugar-planting until the outbreak of the Civil War. Enlisting at first as a private in the Louisiana volunteers, he was rapidly promoted, was appointed colonel of the Thirteenth Louisiana Infantry, and commanded a brigade at Shiloh, where he distinguished himself by leading in person four unsuccessful charges on the famous 'Hornets' Nest.' He fought in the battles of Perryville, Murfreesboro, and Chickamauga, and was promoted to the rank of brigadier, and finally major-general. He participated in the battles during Johnston's retreat from Dalton to Atlanta, at the battles of Jonesboro and Nashville, and in the Mobile campaign. After the war he began the practice of law in New Orleans. He was elected to Congress in 1872, but was not seated. On his second election, in 1874, however, he was allowed to take his seat, and remained in the House of Representatives until 1882, after which, until his death, he was a member of the United States Senate.

GIBSON, THOMAS MILNER (1806-84). An English statesman. The only son of Major Milner-Gibson, he was born at Port of Spain, Trinidad, West Indies, September 3, 1806. He was first educated at Dr. Cogan's Unitarian School, Walthamstow, where Benjamin Disraeli was his classmate. He entered at the Charterhouse School in 1819, and in 1830 proceeded B.A. at Trinity College, Cambridge. In 1837 he entered Parliament as Conservative member for Ipswich, but became a Liberal, and resigned two years later. He assumed the surname of Milner-Gibson by royal license in 1839. After unsuccessful attempts to reënter Parliament, he was returned for Manchester in 1841. In 1846 Lord John Russell made him Privy Councillor and vice-president of the Board of Trade. As president of the Association for the Repeal of the Taxes on Knowledge, his crusade against the excise on paper, the advertisement duty, and the newspaper stamp duty, resulted in the repeal of these taxes in 1861, and Milner-Gibson was the recipient of a public testimonial. At the outbreak of the Crimean War he identified himself with the 'Peace Party' of Cobden and Bright. His views were distasteful to his constituency, and he was unseated in 1857; but the same year was returned for Ashton-under-Lyne, which he represented till 1868, when his defeat at the general election led to his retirement from political life with a pension of £2000. From 1859 to 1866 he was president of the Poor-Law Board, and president of the Board of Trade with Cabinet rank. He was a justice of the peace and deputy lieutenant for Suffolk, and after his retirement was one of the most diligent of the Public Works Loan Commissioners. He was an enthusiastic yachtsman, senior member of the Royal Yacht Squadron, and an elder brother of the Trinity House. He died on board his yacht at Algiers, February 25, 1884.

GIBSON, WILLIAM (1788-1868). An American surgeon, born in Baltimore, Md. He graduated at Princeton in 1806, and at the University of Edinburgh in 1809, and fought with the Allies at Waterloo in 1815. From 1819 to 1855 he was professor of surgery in the University of Penn-

sylvania. He was the friend of Lord Byron, and of many noteworthy English and European surgeons. He published *Principles and Practice of Surgery* (2 vols., 1824), once widely used, and *Rambles in Europe* (1839). Consult Gross, *Sketches of Contemporaries*.

GIBSON, WILLIAM HAMILTON (1850-96). An American painter, illustrator, and author. He was born at Sandy Hook, October 5, 1850. He studied at the Polytechnic Institute, Brooklyn, and afterwards at Washington, Conn. He began his career as an artist with illustrations of botanical drawings for the *American Agriculturist* and *Hearth and Home*; also for *Harper's Magazine* and the *Art Journal*. Gibson's drawings are very correct and minute in detail, and he used a few tints exquisitely. His subjects include the interpretations of woodland beauties, and of flowers and insects. His art is pervaded with the accuracy of the lover of scientific fact, and he was a successful lecturer on botany. He was author and illustrator of the following publications: *Camp Life in the Woods* (1876); *Highways and Byways* (1883). He made the illustrations for E. P. Roe's *Nature's Serial Story*. He died at Washington, Conn., July 10, 1896.

GICHTEL, gik'tel, JOHANN GEORG (1638-1710). A German theosophist. He was born in Regensburg, and was a lawyer by profession. In 1664 he came under the influence of the Theosophists, and thenceforth devoted himself entirely to their doctrines. His teachings brought him frequently into conflict with the authorities. Banished from his native town, he betook himself to Holland, where the same experience was repeated. After 1668 he lived at Amsterdam. He founded an order whose members called themselves 'Angelic Brethren,' because they renounced marriage. He made the first collected edition of the writings of Jakob Boehme (Amsterdam, 1682). His own writings appeared in a collected edition at Leyden in 1722, and his biography, in connection with Boehme's, was written by Harless (Leipzig, 1882).

GID (from *giddy*), or **STURDY**. A disease of sheep, caused by the presence of the larva of a tapeworm (*Tænia canurus*) in the brain. Before the life history of this parasite was discovered the larva was known as *Cenurus cerebralis*, which sometimes attains the size of a hazelnut. It floats in a watery fluid inclosed in a membranous sac. Should the larva be eaten by a dog, it becomes a vermiform parasite, and lays eggs which, being voided by the dog, may be picked up by the sheep while grazing, finally to reach the brain by way of the arteries. Rabbits and even sheep may also serve the same office as the dog in the life cycle of the worm. The afflicted sheep staggers when moved, turns stupidly around almost in one spot, usually toward the side upon which the parasite lies, and loses flesh because these conditions interfere with food-prehension. The parasite and its sac may generally be safely removed by placing the sheep, with its feet tied, on a table or bench, searching for the softened portion of the skull, which generally overlies the hydatid, laying back a flap of skin, and introducing the trochar and canula, and when the sac is deep-seated, cautiously withdrawing it with the help of a small syringe. Protected by a leather cap and simple water-dressings, the wound speedily heals. In

preventing the spread of this disease, which is especially common in low, damp pastures, and among sheep from 6 to 20 months old, it is desirable to burn the heads of affected sheep, otherwise they may be eaten by dogs in which the immature tapeworms would develop to the adult egg-laying form.

GIDDINESS. See **VERTIGO**.

GIDDINGS, gid'dingz, FRANKLIN HENRY (1855—). An American sociologist and economist, born at Sherman, Conn. He graduated at Union College (1877), and engaged in newspaper work, writing on politics and economics for the *Springfield Republican* and the *Springfield Daily Union*. In 1888 he was appointed lecturer in political science at Bryn Mawr, where he was subsequently advanced to the chair of political science. In 1894 he was appointed professor of sociology at Columbia University. His principal works are: *The Modern Distributive Process* (1888), in the publication of which he collaborated with Prof. J. B. Clark; *Principles of Sociology* (1896); *Elements of Sociology* (1898); *Democracy and Empire* (1900); and *Inductive Sociology* (1901). Although the works of Professor Giddings have contributed much to the science of sociology, his position is primarily that of a systematizer of knowledge already demonstrated. The working principle by which he seeks to explain the fundamental sociological phenomena is psychical in its nature — 'consciousness of kind' in his earlier works; 'like response to like stimuli' in his latest volume. In this he differs radically from the school of contemporary writers, who seek to explain sociological facts in terms of the environment. See **SOCIOLOGY**.

GIDDINGS, JOSHUA REED (1795-1864). An eminent American legislator, prominent as a 'Constitutional' Abolitionist in the anti-slavery struggle. He was born at Tioga Point, Pa., October 6, 1795. His early life was spent in Canandaigua, N. Y., until his parents removed to Ashtabula County, Ohio, where he afterwards resided. He enlisted as a soldier in the War of 1812, and served for a few months in the protection of the Western Reserve against the Indians; then taught school, studied law, and in 1821 began professional practice at Jefferson. In 1826 he was sent to the State Legislature, and in 1838 to Congress. The slavery agitation had already begun, and Giddings became a forceful advocate of the abolition of slavery in the District of Columbia and the national Territories. He supported the efforts of John Quincy Adams to maintain the right of petition, and in fact seized upon every opportunity to develop a public sentiment hostile to slavery. On February 9, 1841, he delivered a powerful speech upon the Indian War in Florida, insisting that it was waged in the interest of slavery. While the excitement caused by the Creole Case (q.v.) was at its height, he introduced in the House of Representatives a series of resolutions declaring that the slaves, having simply asserted their inalienable right to liberty, were guilty of no crime, and that as soon as they left the jurisdiction of Virginia they became free. The resolutions created a tumultuous excitement, and Giddings was censured by vote of the House for presenting them. He thereupon resigned his seat, but was reelected by a very large majority. He was kept at his post by successive reflections

until 1859, thus completing a continuous service of twenty years. Until 1848 he was a member of the Whig Party, supporting its principal measures, but maintaining his independence in all matters relating to slavery. He did much to develop those views with regard to the relation of slavery to the National Government which afterwards became the basis of the Republican Party. He took a prominent part in the struggle to prevent the extension of slavery to the territory wrested from Mexico by the war of 1846-47, and in resisting the adoption of the Compromise of 1850, especially the reenactment of the Fugitive Slave Law (q.v.). He was also conspicuous in the debates which preceded the repeal of the Missouri Compromise in 1854, and in the great struggle by which Kansas was made a free State. On May 8, 1856, while addressing the House, he suddenly fell to the floor in a state of unconsciousness. He soon revived, but his former strength was never fully restored. On January 17, 1858, he fell again in the same way, and for a time was supposed to be dead. He again rallied, however, but was compelled for a time to leave his post. In 1861 he was appointed Consul-General for the British North American Provinces, with headquarters in Montreal. In 1843 he wrote a series of political essays signed 'Pacificus,' which attracted wide attention. A volume of his speeches was published in 1853. He also wrote: *The Exiles of Florida* (1858), and *The History of the Rebellion: Its Authors and Causes* (1864). Consult: Buel, *Joshua R. Giddings* (Cleveland, 1882); and, more particularly, Julian, *Life of Joshua R. Giddings* (Chicago, 1892).

GIDE, zhéd, CHARLES (1847—). A French political economist, born at Uzès (Gard). From 1874 to 1880 he was professor of jurisprudence at Bordeaux, and in the latter year became professor of political economy at Montpellier. He also was appointed editor of the *Revue d'économie politique*. He became a leader in the movement toward 'Christian Socialism' organized by French Protestants, and in his writings expressed the views of the classical French school of economics. In addition to numerous contributions to reviews, his publications include: *Du droit d'association en matière religieuse* (1872); *Principes d'économie politique* (1884); and *Etude sur l'Act Torrens* (1886).

GIDE, Théophile (1822-90). A French historical and genre painter, born in Paris, where he studied under Delaroche and Cogniet. His scenes from popular life in Italy are very truthful and characteristic, but he treated the historical genre and interiors with equal success. Especially noteworthy are: "Condemnation of Cinq Mars" (1855); "Sully Leaving the Court of Louis XIII." (1863); "Monks at Study" (1866, Alençon Museum); "Pius IX. Visiting a Nunnery" and "Rehearsal of a Mass" (1866, Roubaix Museum); "Louis IX. Surprised at Prayer by his Jester" (1877); "Checkmate" (1884); and "A Painter in the Convent" (1887).

GIDEL, zhédél', CHARLES ANTOINE (1827-1900). A French author, born at Gannat (Allier). He was a professor successively at the Lycée Henri IV., the Lycée Louis le Grand, and the Lycée Condorcet. His most important work is the *Histoire de la littérature française depuis son origine jusqu'à la renaissance* (1874-88).

His *Etude sur Saint-Evremond* (1866) was awarded the *prix d'éloquence* by the Academy.

GIDEON, gid'ə-on (Heb. *Gid'on*; perhaps connected with *gada'*, to fell). A Hebrew warrior, also called Jerubbaal and once (II. Sam. xi. 21) Jerubbesheth. According to the biblical narrative, Gideon delivered the Hebrews from the oppression of the Midianites, and became one of the 'judges' of Israel, and his son Abimelech was made 'king' in Shechem (Judges vi.-ix). The modern critics look upon Gideon as a popular hero, whose story has received embellishments of a more or less distinctly legendary character. Even when stripped of these legendary features, the narrative is still regarded as quite complicated, and, in order to explain it, it is assumed that Gideon and Jerubbaal are two distinct personages. Changes are also made in the text, which is undoubtedly very corrupt. On this assumption Gideon belongs to the western section of Manasseh, Jerubbaal to the eastern; or perhaps to the clan of Gad. The stories and legends regarding these heroes, after being confused in the minds of the people, have been combined by successive narrators and redactors into a single tale. In the case of both heroes, the opponents against whom they contend successfully are Midianites, a term which becomes in the hands of Old Testament writers a general designation for the rude Bedawin hordes which at all times, even to the present day, have rendered life uncertain among the peaceful agricultural population of Palestine and Syria. According to the original Gideon narrative, these Bedouin invaders choose the harvest-time as the most favorable moment of attack, when they are certain of reaping a rich booty. Gideon at Ophrah receives the summons through Yahweh to gather his clansmen in order to resist the expected attack of the nomads. Warriors of Ephraim join with those of Manasseh, and the march is begun to Mount Gilboa, beneath which the Midianites are encamped. Gideon approaches the camp stealthily, and, encouraged by hearing one of the Midianites relating to his fellow a significant dream, returns to the Hebrew camp. With the war cry 'the sword of the Lord and of Gideon' the Hebrews rush upon the Midianites, who are utterly routed, and flee to the distant slopes of Abel Meholah, or, as some critics propose to read, Abel-beth-maacah. They are followed by the victorious Hebrews, who succeed in capturing two of the princes of the Midianites, Oreb and Leeb, and their heads are brought to Gideon. In the original Jerubbaal story the hero, residing at Jazer, is represented as proceeding with ten members of his household at night against the Midianites, and inflicting a slaughter among them. In revenge the Midianites turned against Jerubbaal's brethren, slew them, and went on plundering and killing far to the north. Jerubbaal now gathers three hundred warriors of his clan around him, and after enduring many hardships on the road, finally encounters the Midianites at Karkor. By means of a stratagem he surprises and throws the Midianites into a panic, the result of which is a complete defeat of the marauders. Jerubbaal caught the two kings of Midian, Zebah and Zalmunna, and put them to death. In the legendary amplification of this narrative, Jerubbaal is recognized as king by his people, and since, as a worshiper of Jehovah, it seemed distasteful to later editors that he should

have a name which contained Baal as an element, the name is interpreted and modified as though it indicated 'opposition to Baal' (Judges vi. 32), and in one instance (II Sam. xi. 21) is disguised by substituting *besheth* for it. (See BAAL.) In general, however, the name Gideon is quietly substituted for Jerubbaal. The similarity of the two stories no doubt was one element which led to their confusion in the minds of the people, but the combination is essentially the work of narrators who aimed at reconstructing the past from the point of view of zealous devotees of Jehovah. In the course of the narratives stress is laid on the fact that the oppression of the Midianites is a punishment sent because the people had fallen away from Jehovah, while Gideon is represented as a Jehovah purist, who at the risk of his life destroyed the Baal altars in his town (Judges vi. 25-32). Consult the chapters on Gideon-Jerubbaal in the Hebrew histories of Stade, Kittel, Guthe, Wellhausen, and the commentaries on the Book of Judges by Studer, Bachmann, Moore, and Budde; also Niebuhr, *Studien zur Geschichte des alten Orients*, vol. i. (Berlin, 1894); Budde, *Richter und Samuel* (Giessen, 1890).

GIEBS, gēr, NIKOLAI KARLOVITCH DE (1820-95). A Russian statesman. He served for some years in the Asiatic Department of the Ministry of Foreign Affairs, and was sent as Minister Plenipotentiary to Teheran in 1863, to Bern in 1869, and to Stockholm in 1872. After his marriage into the family of Prince Gortchakoff, the latter made him his adjunct. In 1882 Giers succeeded the Prince as Minister of Foreign Affairs, having meanwhile shown himself an astute diplomat in the negotiations with Great Britain on the Afghan boundary question; and in this position he was noteworthy for wise conservatism and the maintenance of peaceful relations with other European powers.

GIERYMSKI, gēr-m'skē, MAX (1846-74). A Polish genre painter, born at Warsaw. After having fought against Russia during the insurrection of 1863, he studied music at Warsaw until 1865, when he went to Munich, in order to devote himself to painting, and became a pupil successively of Alexander Wagner, Franz Adam, and Schleich. Although his career was short, he produced some very characteristic work, notably "Polish Spinning Room," "A Pistol Duel on Horseback," "Jews at Prayer," "Insurgents in the Woods," "Cossacks on the March," and "Stag Hunt in the Eighteenth Century" (1874, National Gallery, Berlin). He was elected a member of the Berlin Academy in 1872.

GIESEBRECHT, gē'ze-brēkt, FRIEDRICH WILHELM BENJAMIN VON (1814-89). A German historian, born in Berlin. He pursued historical studies at the University of Berlin as a pupil of Leopold von Ranke. In 1857 he was appointed professor of history at Königsberg, and in 1862 accepted a call to Munich. His *Geschichte der deutschen Kaiserzeit* (vol. i., 1855; vol. v., 1888), a monumental undertaking for which the Berlin Academy awarded him the prize established by Friedrich Wilhelm IV. in recognition of distinguished service to German history, is marked in the earlier volumes by much attractiveness of presentation, and throughout by a minute and exacting investigation of sources. He further published several learned essays and *Deutsche Reden* (1871), a collection of addresses pro-

nounced on academic occasions. Consult a memorial oration by Riezler (Munich, 1891).

GIESELER, gē'ze-lēr, JOHANN KARL LUDWIG (1792-1854). One of the greatest of Church historians. He was born March 3, 1792, at Petershagen, near Minden, Westphalia, where his father was a clergyman. He was educated at Halle, and in October, 1813, entered the army as a volunteer during the War of Liberation. In 1818 he was appointed to the directorship of a newly instituted gymnasium at Cleves, and published his *Historisch-kritischer Versuch über die Entstehung und die frühesten Schicksale der schriftlichen Evangelien*. In consequence of this publication he was called, in 1819, as professor of theology, to the University of Bonn, which had been established but shortly before. It was in this place that he began his great work on Church history, of which three volumes appeared during his life, and two more after his death, under the editorship of E. R. Redepenning (Bonn, 1823-52, 3 vols., in 8 parts; 4th ed. of first four parts, 1844-48; 2d ed. of fifth part, 1849; posthumous ed., vols. iv. and v., 1854-55; Eng. trans. revised and corrected by H. B. Smith, New York, 1855-80, 5 vols.). Vol. vi. (1856) contains his *Dogmengeschichte*. In 1831 Gieseler was called to a chair in Göttingen. Besides numerous contributions to periodicals and publications on contemporary questions, he edited Euthymius Zygabenus, *Narratio de Bogomilis* (Göttingen, 1842), as well as Petrus Siculus, *Historia Manichæorum seu Paulicianorum* (Göttingen, 1846). He died at Göttingen, July 8, 1854. For his life by Redepenning, consult vol. v. of his *Kirchengeschichte* (vol. i. of the Eng. trans.).

GIESSBACH (gēs'bāk) FALLS. A picturesque cataract of Switzerland, falling into Lake Brienz (q.v.). It consists of seven cascades, formed by the Giessbach stream during a descent of 980 feet from its source in the Schwarzhorn. The largest cascade has a fall of 190 feet.

GIESSEN, gēs'sen. A town of Hesse, capital of the Province of Upper Hesse, situated at the confluence of the Wieseck and the Lahn, 41 miles by rail north of Frankfurt (Map: Germany, C 3). It has a number of fine modern churches, an old Rathaus, and a university. The university, founded in 1607, was removed to Marburg in 1625, and reestablished at Giessen in 1650. It has four faculties, with an attendance of about 800 students, a good library, founded in 1617, a chemical laboratory arranged by Liebig (who was a professor here), botanical gardens, and several institutes and collections. Giessen has also a teachers' seminary, a gymnasium, a school of agriculture, etc. The chief manufactures are machinery and other metal products, textiles, chemicals, tobacco and cigars, musical instruments, etc. Population, in 1890, 20,571; in 1900, 25,491, chiefly Protestants. Giessen dates from the twelfth century, and was formerly fortified.

GIFFEN, gif'fen, Sir ROBERT (1837—). An English statistician and economist. He was born at Strathaven, Lanarkshire, and was educated at the parish school in his native town, and at Glasgow College. In 1860 he began newspaper work as a reporter on the staff of the *Stirling Journal*. In 1862 he obtained a position on the *London Globe*, which he occupied until 1866, when he was engaged as assistant to John Mor-

ley, in the *Fortnightly Review*. From 1868 to 1876 he was the assistant editor and principal contributor to the *Economist*, under the editorship of Walter Bagehot, and served during part of the same time (from 1873 to 1876) as city editor of the *London Daily News*, for which he furnished the daily trade and financial article. In 1876 he was appointed chief of the statistical department of the Board of Trade. He continued to hold office after it was merged, in 1882, with that of assistant secretary of the Board of Trade. Another change in the organization of his department was made in 1892, when he was appointed comptroller-general of the commercial, labor, and statistical departments. He retired in 1897. His writings include frequent contributions to the *Fortnightly Review*, the *Spectator*, the *Saturday Review*, and other journals and magazines, in numerous reports of exceptionally great value, and the following publications: *American Railways as Investments* (1873); *Stock Exchange Securities* (1878); *Essays in Finance* (1st series 1879, 2d series 1886); *The Progress of the Working Classes in the Last Half Century* (1884); *The Growth of Capital* (1890); and *The Case Against Bimetallism* (1892).

GIFFORD, giff'fôrd, ADAM (1820-87). A Scotch jurist and philanthropist, born in Edinburgh. He was admitted to the Scotch bar in 1849, and in 1865 was appointed sheriff of Orkney and Zetland. In 1870 he became a judge of the Court of Sessions, with the title of Lord Gifford. He gave by his will £80,000 to endow lectureships in natural theology at the four Scotch universities—Edinburgh, Glasgow, Aberdeen, and Saint Andrews.

GIFFORD, ROBERT SWAINE (1840-1905). An American landscape painter and etcher. He was born on the island of Naushon, Gosnold (Mass.), December 23, 1840, and studied marine painting with Albert van Beest, in Rotterdam. He became a member of the New York Water Color Society in 1865, making his home in New York for three years. In 1869 he visited California and Oregon; in 1870-71, Europe and Africa. Again in 1874-75 he was in Europe. Most of his important works are oil paintings, and they are typical scenes of New England landscapes. Perhaps those that portray the coast are the most interesting.

GIFFORD, SANFORD ROBINSON (1823-80). An American landscape painter. He was born at Greenfield, N. J., July 10, 1823. He attended Brown University from 1842 to 1844. He studied with the water-color painter John R. Smith of New York, a son of the celebrated London engraver. In 1851 he was elected associate of the Academy, and in 1854 he was made Academician. He made a sketching tour through England and Scotland in 1855; then went to Paris, and in 1856 he visited Belgium, Holland, Switzerland, and Italy, spending the winter of the same year in Rome. The following year he spent in Abruzzi, Naples, and Austria. Returning to New York at the beginning of the Civil War, he enlisted in the Seventh Regiment. He remained with the army through the years 1862-63. In 1868 he visited Greece, Syria, Egypt, Turkey, and Italy. In 1870 he went to the Rocky Mountains and to Alaska. In 1874 he sketched on the shores of Lake Superior. Gifford's pictures are expressive of the poetic qualities in landscape.

GIFFORD, WILLIAM (1756-1826). An English author. He was born at Ashburton, Devonshire, in April, 1756. Left an orphan at twelve, he was first a cabin-boy and then an apprentice to a shoemaker. Aided by a local surgeon who had seen some of the boy's verses, he was sent to Exeter College, Oxford, where he was graduated B.A. in 1782. He now traveled on the Continent for 'many years' as tutor to the son of Lord Grosvenor. His first publication was the *Baviad* (1794), a satire on a group of scribblers known as 'Della Crusicans' (q.v.). This was followed by the *Mæviad* (1795), a similar satire on some of the contemporary dramatists; and by a savage attack on Dr. John Wolcot, entitled *An Epistle to Peter Pindar* (1800). Wolcot retaliated with the feeble *Cut at a Cobbler*. In 1802 appeared a translation of Juvenal, which Gifford had begun at the university, and to which he now prefixed an autobiography. Gifford, who had gained the favor of Canning and his political friends, edited the *Anti-Jacobin* in 1797-98; and in 1809 he was appointed the first editor of the *Quarterly Review*. He was soon recognized as one of the severest reviewers of the time. Having no sympathy with the new schools of poets and critics, he attacked Hazlitt, Hunt, Lamb, Wordsworth, Shelley, and especially Keats, with great bitterness. (Consult review of Keats's "Endymion," in the *Quarterly*, April, 1818.) He resigned from the *Quarterly* in 1824, having amassed a fortune of £25,000. He died December 31, 1826, and was buried in Westminster Abbey. Gifford is perhaps best known to scholars by his editions of Massinger, Ben Jonson, and Ford, and notes to Shirley used by Dyce in his edition of the dramatist. This work, however, was not done very carefully. The *Baviad* and the *Mæviad* are in *British Poets*, edited by Frost (Philadelphia, 1838).

GIFT (AS., OHG. *gift*, from AS. *gifan*, Goth. *giban*, OHG. *geban*, Ger. *geben*, to give). Gift, in the broadest sense, includes every gratuitous transfer of property, whether real or personal, and whether made orally, by deed, or by will. As a specific legal term, however, it is limited to a present transfer of property without consideration. In this sense it is distinguishable from a devise or legacy on the one hand (which takes effect in the future, upon the giving owner's death) and from a barter, a grant, or a sale on the other, in each of which transactions a transfer is made upon a valuable consideration. Gifts are divisible into two classes, those *causa mortis* and those *inter vivos*. The first class has been discussed in the article on DONATION (q.v.).

It has been judicially declared that the elements necessary to the validity of a gift *inter vivos* are the following: (1) That the donor must be competent to contract; (2) there must be freedom of will; (3) the gift must be complete, with nothing left undone; (4) the property must be delivered by the donor and accepted by the donee; (5) the gift must go into immediate and absolute effect. If either of the first two elements is wanting, the gift may be avoided and the property regained by the donor, because of his legal incapacity to transfer property, or because he was the victim of fraud, duress, or undue influence. In case, however, all these essentials are present, the transfer becomes irrevocable as between the donor and donee. Even then, if it

leaves the donor insolvent it may be set aside by his creditors as a fraudulent conveyance.

The third essential of a gift—that it must be complete—distinguishes the transaction from a promise to give. A person makes a present of his promissory note for \$1000 to another. Here is no gift; only a promise to give. As a promise it is unenforceable because there is no legal consideration for it. Had the donor presented the donee with the promissory note of a third person, a gift would have been consummated. Whether the delivery to another of the donor's check constitutes a gift of so much of his bank deposit as is named in the check, or is to be considered simply a promise to give, is a question upon which the courts are divided. The weight of authority is in favor of the latter view. Any substantial act on the part of the owner of property, tending to carry the gift into effect, and to give the donee dominion over the property so that he can appropriate it to his use, will amount to a valid and effectual gift. Accordingly a savings-bank deposit may be effectually given to another by delivering to the latter the deposit book accompanied by an assignment, or by other acts which disclose the donor's intention to presently pass title and vest the donee with dominion over the fund. Oftentimes a transaction which fails of effect as a gift is upheld by the courts as a declaration of trust (q.v.) in favor of the intended donee. This will not be done, as a rule, unless it is apparent that the owner of the property actually intended to create a trust.

Delivery of the property, which constitutes the fourth essential according to the judicial statement above referred to, may be actual or constructive; thus if the property is already in the donee's possession, it is sufficient if the parties treat the property as thereafter owned as well as possessed by the donee. Neither does the law require actual acceptance by the donee in all cases. If the gift is wholly beneficial to him, his acceptance will be presumed until evidence of rejection by him is given.

The fifth requisite of a valid gift is that it go into immediate and absolute effect. The words of donation must be those of present, complete, and final transfer to the donee. Consult *Kent, Commentaries*, and the authorities referred to under *CONTRACT*.

GIFU, gē'foo'. A prefectural town of Japan, situated in the southern part of Nippon, 19 miles by rail from Nagoya (Map: Japan, E 6). The chief products are silk and paper goods. Population, in 1898, 31,942.

GIGG. See *JIG*.

GIGNOUX, zhé'nyoo', FRANÇOIS RÉGIS (1816-82). A French landscape painter, born at Lyons. He studied art at Lyons and in the Ecole des Beaux-Arts in Paris, and with Delaroche. In 1840 he came to the United States, and in that year became a member of the National Academy. He returned to France in 1870. His pictures are studies of nature in her more cheerful aspects. Among his productions are: "Spring;" "The First Snow;" "The Indian Summer;" "Niagara in Winter;" "The Bernese Alps at Sunrise;" and "Niagara by Moonlight." A number of his pictures are in private possession in New York City. He died in Paris, August 6, 1882.

GIGOUT, zhé'goot', EUGÈNE (1844-). A French organist and composer, born at Nancy.

He studied under Saint-Saëns in Paris, and in 1863 became organist of Saint Augustin's, subsequently making extended concert tours through Europe and England. In 1885 he founded an organ school in Paris, which was subsidized by the Government. Gigout's compositions are mostly for the organ, and are written in a simple, severe form. He is a chevalier of the Legion of Honor.

GIGOUX, zhé'goot', JEAN (1809-94). A French painter and illustrator, born at Besançon. He was a pupil of the Ecole des Beaux-Arts, and first exhibited in 1832. His best painting is "The Death of Leonardo da Vinci" (1835) in the Museum of Besançon. It is a solidly painted, realistic conception of the scene. These traits characterize his other works: "The Death of Cleopatra;" "The Eve of Austerlitz;" "The Good Samaritan;" "A Young Girl;" and the portraits of Fourier and Donzelot. The last three are all in the Luxembourg. His drawings include six hundred designs for an edition of *Gil Blas*, and a fine drawing of "Charlotte Corday" (1848). His collection of drawings and lithographs was left to his native town. He wrote an interesting book, *Causeries sur les artistes de mon temps* (1855), full of anecdote and art talk. He received the medal of honor at the Paris Exposition of 1889, and the cross of the Legion of Honor in 1885.

GIHON, gī'hon, ALBERT LEARY (1833-1901). An American physician and surgeon, medical director in the United States Navy, born in Philadelphia, Pa. He graduated in 1852 at the College of Medicine and Surgery in that city, in 1853-54 was professor of chemistry and toxicology in the College of Medicine, and in 1855 became an assistant surgeon in the United States Navy. In 1861 he was appointed surgeon, and in 1879 medical director. In 1895 he became senior medical director of the navy, and in the same year was retired with rank of commodore. He designed the model hospital ship exhibited at the Centennial Exhibition of 1876, and invented an ambulance cot, adopted in 1877 under his name for use in the navy. At various times he was president of the American Public Health Association, the American Academy of Medicine, and the Association of Military Surgeons of the United States. He wrote *Practical Suggestions in Naval Hygiene* (1871), and many papers, reports, and fugitive articles.

GIJÓN, hē'hōn'. An important seaport in the Province of Oviedo, Spain, 20 miles by rail north-northeast of the city of Oviedo (Map: Spain, C 1). It is situated on a peninsula projecting into the Bay of Biscay, and is one of the most flourishing towns of Asturias, its population having increased with the development of its commerce and its growing popularity as a watering place. The town is well built, the more modern quarters with wide, straight streets; a number of new buildings, including markets, a town hall, etc., have been constructed. There are statues in honor of Pelayo and Gaspar de Jovellanos, the latter a native of Gijón, who in 1794 founded the Instituto Jovellanos, which has a valuable art collection; and the Campos Eliseos with a theatre, circus, and extensive gardens. Gijón has also a large bull-ring and fine promenades; the parish church of San Pedro (fifteenth century) and the two palaces are further objects of interest. One of the old ecclesiastical build-

ings has been converted into a Government tobacco factory which employs some 1500 persons. The manufacturing establishments comprise also glass and pottery works, foundries and machine shops, wire and wire-nail factories, petroleum refineries, etc. The town, including a considerable area that is chiefly mountainous, is the port for a rich mining district, and carries on an extensive export trade in coal, copper, iron, and other minerals, lumber, and nuts. The coastwise trade is also important. Increased railroad facilities and improvements in the harbor have promoted Gijón's commerce. Population, in 1900, 46,813. Gijón is identified with the ancient *Gigia* or *Gijia*, though not on the exact site of the Roman town. Captured by the Arabs, it fell into the hands of Pelayo after the battle of Covadonga, and until near the close of the eighth century was the capital of the Asturian princes. The shattered 'Invincible Armada' repaired here in 1588.

GILA, hē'lā. A river of the United States. It rises in the Sierra Madre Mountains (q.v.) in New Mexico, and, flowing in a general westward direction across Arizona, joins the Colorado about 180 miles above where the latter empties into the Gulf of California (Map: Arizona, B 3). For the greater part of its length, which is nearly 500 miles, the Gila flows through mountain cañons, the sides of which are in many places so precipitous as to render the stream almost unapproachable. The lower part of its course is through an open and comparatively level country, much of which is made fertile by irrigation from the river. Ruined edifices, one of which is three stories high and in a fair state of preservation, broken pottery, and traces of irrigation canals along its banks show that its riparian dwellers of former times were numerous and partly civilized. About 200 miles from its mouth, in a productive portion of the valley, is the reservation of the Pima and Maricopa Indians.

GILA MONSTER (named after the *Gila*, a river in Arizona). A poisonous lizard (*Heloderma suspectum*) found in the sandy deserts of Arizona, New Mexico, and Texas. It is one of the largest lizards in North America, is closely allied to the caltetepon (*Heloderma horridum*) of Mexico, and is fat, inactive, and stupid. It is covered with bright orange and black pebble-like scales, and, like snakes, it has grooved teeth and large salivary glands at their bases. Its bite is injurious, though not often fatal to man. Drs. S. Weir Mitchell and E. F. Reichert found that the saliva injected into pigeons and fowls was quickly mortal; but the experiments of Dr. Irwin of the United States Army (1862-63), Dr. H. C. Yarrow of the United States National Museum, and of Samuel Garman, have failed to substantiate the earlier conclusions, so that the question of the poisonous nature of this lizard is not definitely settled. An illustrated monograph upon its anatomy was contributed by Shufeldt to the Zoölogical Society of London, and printed in their *Proceedings* (London, 1900). See **HELODERMA**; and **PLATE OF IGUANA AND OTHER AMERICAN LIZARDS**.

GILAN, gē-lān'. See **GHILAN**.

GILBERT, SAINT. See **GILBERTINES**.

GILBERT, gil'bert, Mrs. ANNE HARTLEY (1821-1904). A well-known and popular actress.

She was born in Lancashire, England, and in her youth became a dancer. In 1846 she was married to George H. Gilbert, with whom, after appearing in many of the British theatres, she came to this country in 1849. Her first hit in a speaking part was as Wicahenda in Broughman's *Pocahontas* (1857). In 1869 she joined Daly's company, and became familiar in the characters of the odd elderly ladies of the stage, such as Mrs. Candour in *The School for Scandal*, Mrs. Hardcastle in *She Stoops to Conquer*, and many others. After Mr. Daly's death she came under Charles Frohman's management, and later became a member of Annie Russell's company. Her eightieth birthday was celebrated in Saint Louis, where she was supporting Miss Russell in *The Royal Family*. Mrs. Gilbert published her stage reminiscences in 1901.

GILBERT, CHARLES BENAJAH (1855—). An American educator, born at Wilton, Conn. He graduated at Williams College in 1876, and was principal of high schools at Mankato, Winona, and Saint Paul, Minn., and Beaver Dam and Oshkosh, Wis. From 1889 to 1896 he was superintendent of schools at Saint Paul, and from 1896 to 1901 at Newark, N.J. In 1901 he accepted a similar post at Rochester, N. Y. He was elected president of the National Association of School Superintendents in 1897, and in 1897-1900 was a lecturer at the Teachers' College of Columbia University. With S. L. Arnold he wrote *Stepping Stones to Literature* (1897).

GILBERT, DAVID MCCONAUGHY (1836—). An American clergyman and author, born at Gettysburg, Pa. He studied there at Pennsylvania College, and the theological seminary of the Lutheran Church, and was ordained in 1860 to the ministry of that denomination. His pastorates were at Staunton, Va., in 1859-63 and 1871-73; at Savannah, Ga., in 1863-71; and at Winchester, Va., from 1873. In 1886 he was elected first president of the United Southern Synod of the Lutheran Church. Among his publications are: *The Lutheran Church in Virginia, 1776-1867* (1876); *The Synod of Virginia: Its History and Work* (1879); and *The Annihilation Theory Briefly Examined* (1879).

GILBERT, zhél'bar', FRANÇOIS AMBROISE GERMAIN (1816-91). A French sculptor, born at Choisy-le-Roi (Seine). He was best known for his work in what is generally classed as industrial sculpture, such as elaborate centre-pieces for dining-tables, and the like. The decoration of the Bourse at Marseilles, the restoration of the sculptures in the Rheims Cathedral, and a bas-relief in the Church of Saint Augustine, Paris, were also executed by him.

GILBERT, gil'bert, GROVE KARL (1843—). An American geologist, born in Rochester, N. Y. He graduated from the university in that city in 1862. For several years he studied geology and paleontology with Prof. H. A. Ward, of Rochester, supplementing his studies by field work with the Ohio Geological State Survey in the capacity of assistant. In 1871 he received an appointment to the United States Geological Survey. As assistant to Major J. W. Powell, the director of the Survey, he was engaged from 1875 to 1879 in mapping and describing the geology of portions of the Rocky Mountain region. Afterwards he was placed in charge of the

Appalachian Survey, and for a time held the office of chief geologist. He was one of the first to study the relations between geological structure and surface features, and in this connection he rendered most valuable services to science. Some of his more important contributions to geological literature are: *Report on the Geology of the Henry Mountains* (1877); *Report on the Geology and Resources of the Black Hills of Dakota* (1880); *The Topographic Features of Lake Shores* (1885); and *Lake Bonneville* (1890).

GILBERT, Sir HUMPHREY (1539?-83). An English soldier and navigator. He was born at Compton, Devonshire, and was, on his mother's side, a half-brother of Sir Walter Raleigh. He was educated at Eton and at Oxford. He saw active service in Normandy under the Earl of Warwick, in 1563, as well as in the Irish campaigns of 1566-70. In 1571 he returned to England, and in the following year was sent into the Netherlands with a force of 1500 English volunteers to aid the Dutch. After a futile campaign Gilbert returned to England, and spent the next five years in retirement in "sundry profitable and very commendable exercises" in literature. During this period he wrote the *Discourse of a Discovery for a New Passage to Cataia*, produced partly in support of two petitions presented to the Queen in 1566, for a commission to search for a northwest or northeast passage. The *Discourse*, with some additions, was edited by the poet George Gascoigne, in 1576. In 1577 Gilbert published another treatise, suggesting a plan of 'reprisals' against the King of Spain, and in 1578 he received a commission from Elizabeth, which covered the privileges of discovery and colonization. An expedition was immediately fitted out by Gilbert and Sir Walter Raleigh, but was dispersed by the Spaniards off Cape Verde, and the next four years were spent by the indefatigable adventurer in endeavors to raise the necessary funds for another undertaking. On June 11, 1583, he sailed from Plymouth with five ships, but the largest—a barque furnished by Raleigh—returned to England after two days at sea. Gilbert made his way across the Atlantic, and on July 30th reached the coast of Newfoundland, and determined to plant his colony near the harbor of Saint John's, where he took possession of the country in the name of the Queen. This, the first English colony in America, was made up of broken-down gentlemen and seamen, and the lawlessness of the community was beyond Gilbert's control. Arrangements were made to return to England, whence Gilbert hoped to make another attempt at colonization in the following spring. Meanwhile he explored the coast of Newfoundland toward the south, and lost his largest ship on the shoals off Cape Sable or Cape Breton Island. Disregarding the advice of his friends, he persisted in sailing in the *Squirrel*, the smaller and less seaworthy of the two remaining vessels. A storm was encountered off the Azores. "On Monday, September 9th," reports Hayes, the captain of the other vessel, the *Golden Hind*, "the frigate was near cast away, yet at that time recovered; and giving forth signs of joy, the general, sitting abaft with a book in his hand, cried out unto us in the *Hind*: 'We are as near to heaven by sea as by land.' That same night the watch

on board the *Hind*, observing that the frigate's lights suddenly disappeared, cried out: 'The general was cast away,' which was too true; for in that moment the frigate was devoured and swallowed up in the sea." Some account of Gilbert's career may be found in Bourne, *English Seamen Under the Tudors* (London, 1868), and also in Markham, *The Fighting Veres* (London, 1888). The original narrative of his voyage is in Hakluyt, *English Voyages* (London, 1600; new ed. 1812; Goldschmid, Edinburgh, 1889). Consult also Payne, *Voyages of the Elizabethan Seamen* (London, 1880).

GILBERT, Sir JOHN (1817-97). An English historical painter, illustrator, and engraver. He was born at Blackheath, July 21, 1817. He learned every technique possible for art expression—oils, water-color, fresco, wood and stone engraving, etching, carving, and drawing—and was in the main self-taught. Gilbert gave most of his attention to illustration, in 1838 beginning with illustrations of a book of nursery rhymes. These were followed by illustrations for the editions of the poets, Cowper (1841), Pope, Burns, and others included in Rutledge's *British Poets* (1853); *Evangeline* (1856); Longfellow's *Poems* (1858); Scott (1857); Wordsworth (1859); Milton (1864). His chief work was 829 illustrations for Howard Staunton's edition of Shakespeare (1856), the proofs of which are in the collections of the British Museum.

In 1843 he sent a few drawings to *Punch*, designing the cover for that year; but for thirty years, following the establishment of the *Illustrated London News*, in 1842, he was a constant contributor; also to the *London Journal*. In 1852 he was elected an associate of the Water-Color Society, and a full member in 1854. He initiated the exhibitions of this society in 1862 by hanging 270 of his own drawings and sketches, which led to a regular winter exhibition. Gilbert was made president of the society in 1871, on which occasion he was knighted. In 1893 he presented to the nation a collection of his works, which were divided among the galleries in London, Birmingham, Liverpool, and Manchester. To the Royal Academy he presented his sketch-books. His life was uneventful; his industry was marvelous, as the number of his drawings—thirty thousand—testifies. He died at Blackheath, October 5, 1897. He was a great draughtsman and illustrator rather than a painter, although he was a good colorist, with a fondness for red; yet he often made his shadows too black. Consult: Spielman, "Sir John Gilbert," in the *Magazine of Art* (London, 1898); Atkinson, *English Artists of the Present Day* (ib., 1872).

GILBERT, JOHN GIBBS (1810-89). An American comedian. Born in Boston, he made his first appearance there at the Tremont Theatre, in 1828, as Jaffier in *Venice Preserved*. His original aim was to be a tragedian; but while on a tour through the South and West, the success of his Sir Anthony Absolute, Master Walter, etc., convinced him that his true bent was for 'old men' parts, and he soon became the leading American actor in that line of comedy. In 1847 he had a successful engagement in London. From 1862 until the close of Wallack's Theatre, New York, he was connected with that house. His most famous rôle was that of Sir Peter Teazle in *The School for Scandal*; his Sir Anthony, Old

Dornton in *The Road to Ruin*, and Lord Ogleby in *The Clandestine Marriage*, were also noted. He died June 17, 1899. Consult: Winter, "A Sketch of the Life of John Gilbert," *Dunlap Society Publications* (New York, 1890); McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); and Carroll, *Twelve Americans: Their Lives and Times* (New York, 1893).

GILBERT, Sir JOHN THOMAS (1829-98). An Irish antiquary, born in Dublin. He received his education at Bective College in Dublin, and at Prior Park College in Bath. His antiquarian tastes developed early. In 1855 he became one of the honorary secretaries to the Irish Celtic and Archaeological Society, and took an active part in organizing the new public record office at Dublin, of which he was appointed secretary (1865-75). In 1855 he was elected to the Royal Irish Academy, of which he was librarian for a quarter of a century. He also held many positions of public trust. In 1892 he received the degree of LL.D. from the Royal University, and in 1897 he was knighted. Gilbert's researches in the sources of Irish history are of the very highest value. Among his numerous works are: *Historical Essays on Ireland* (1851); *Celtic Records and Historical Records* (1852); *History of the City of Dublin* (1854); *Ancient Historical Irish Manuscripts* (1861); *Public Records of Ireland* (1863); *History of the Viceroy's of Ireland* (1865); *Facsimiles of National Manuscripts of Ireland* (1874); *A Contemporary History of Affairs in Ireland from 1641 to 1652* (1879); *Account of Facsimiles of National Manuscripts of Ireland* (1884); *A Jacobite Narrative of the War in Ireland* (1892); *Documents Relating to Ireland* (1893); *Crede Mihi, the Most Ancient Register of the Archbishops of Dublin Before the Reformation, A.D. 1275* (1897).

GILBERT, Sir JOSEPH HENRY (1817-91). An English agricultural scientist, born at Hull (Yorkshire). He studied at Glasgow University, University College, London, and at the laboratory of Liebig, University of Giessen, and in 1840-43 was successively assistant to Prof. A. T. Thompson at University College and chemist to a calico manufactory near Manchester. In 1843 he became associated with Mr. (later Sir) J. B. Lawes (q.v.) in connection with the agricultural experiment station established upon the latter's estate at Rothamsted (near Saint Albans, Hertfordshire). He was director of the laboratory from 1843 until the death of Lawes in 1900, and from that time director of the station. He was appointed professor of rural economy at Oxford in 1884 and 1887. In 1860 he was elected a fellow of the Royal Society, and in 1882-83 was president of the Chemical Society, of which he had been elected a member in 1841. He traveled for scientific purposes in the United States in 1882, 1884, and 1893. The combined services of himself and Lawes to the development of agricultural chemistry, dating from the establishment of the Rothamsted station, one of the first of such institutions, have been epoch-making. In addition to a large number of essays prepared with Lawes for the *Journal of the Royal Agricultural Society of England*, the *Journal of the Chemical Society*, the *Transactions of the Royal Society*, and various other periodicals and reports, he wrote: *Amount and Composition of the Rain and Drainage Waters at Rothamsted* (1882, with

Lawes and Warington); and *Agricultural Investigations at Rothamsted, England, During a Period of Fifty Years* (1895; Bulletin 22 of the United States Official Experiment Station).

GILBERT, LINDA (1847-95). An American philanthropist. She was born in Rochester, N. Y., but when very young was taken by her parents to Chicago, where she was educated in Saint Mary's Convent. She early became interested in the cause of prison reform, and through her efforts libraries aggregating 30,000 volumes, and ranging from 1500 to 2000 volumes each, were placed in various prisons throughout the country. She was also instrumental in securing the incorporation of the Gilbert Library and Prisoners' Aid Society, under the laws of the State of New York, having for its object the improvement of prison discipline, the placing of selected libraries in every prison and jail, the care of prisoners' families when in need, and the assistance of those discharged from prison. The greater part of her work was done in her individual capacity, the society, through lack of funds, having been prevented from proceeding far with the work for which it was organized.

GILBERT, zhèl'bar', LOUIS PHILIPPE (1832-92). A Belgian mathematician, born at Beauraing (Namur). He was a professor at the University of Louvain, a member of the Royal Academy of Belgium, and a correspondent of the Institute of France. His published works, chiefly on pure mathematics and their history, include a *Cours de mécanique analytique* (1877), and *Recherches sur les propriétés géométriques des mouvements plans* (1878).

GILBERT, NICOLAS JOSEPH LAURENT (1751-80). A French poet, born at Fontenay-le-Château, Lorraine. He had already written some mediocre verse and a novel when he went to Paris in 1772. He presented a poem at the Academy, which was not well received, and this seems to have caused him to become a satirist. His works in this vein include: *Le dix-huitième siècle* (1775), and *Mon apologie* (1778). He also wrote some odes, and a few days before his death his best known poem, "Adieux à la vie." For many years he was considered a French Chatterton, and to be dying of want, but as a matter of fact he was in receipt of three pensions at the time. Alfred de Vigny made a hero of him in *Stello*. His complete works were first published in 1788.

GILBERT, gil'bèrt, RUFUS HENRY (1832-85). An American physician and inventor. After graduating at the College of Physicians and Surgeons in New York City, he began medical practice at Corning, N. Y., at the outbreak of the Civil War became a surgeon in the Duryea Zouaves (Fifth New York Infantry), and rose to be medical director and superintendent of the Central Railway of New Jersey. Afterwards he made a study of the rapid-transit problem in New York City, as a result of which he devised the elevated railway, originally in tubular pneumatic forms, but afterwards more nearly resembling the present system. Under his direction the Sixth Avenue Elevated Railway (in New York City), then known as the Gilbert Elevated Railway, was constructed. In 1878 the management of the railway was assumed by the Metropolitan Transit Company. Charges of fraud were subsequently made by Dr. Gilbert against his associates, and much litigation followed.

GILBERT, WILLIAM (1540-1603). A distinguished English natural philosopher and physician, who has been termed 'the father of magnetic philosophy.' He was born at Colchester, of which town his father was recorder. He was a member and subsequently fellow of Saint John's College, Cambridge; was B.A. in 1560, M.A. in 1564, and M.D. in 1569. About the year 1573 he settled in London as a practicing physician, joined the College of Physicians, and was appointed physician to Queen Elizabeth. The time that he could spare from the duties of his profession was employed in philosophical experiments, particularly in relation to the magnet; and in these he was assisted by a pension from the Queen. After holding various offices in the College of Physicians he was finally elected its president in 1600. At the death of the Queen he was continued in his office of Court physician by James I. until his death in 1603. His death seems to have taken place in London; but he was buried at Colchester, in the Church of the Holy Trinity, where there is a monument to his memory. He left his library, globes, instruments, and cabinet of minerals to the College of Physicians. From his birthplace, he is generally designated as Gilbert of Colchester. His important works are: *De Magnete, Magneticisque Corporibus, et de Magno Magnete, Tellure*, *Physiologia Nova* (1600), of which there are several editions; and *De Mundo nostro Sublunari Philosophia Nova* (1651) (published from a manuscript in the library of Sir William Boswell). The first of these works has served as the basis of subsequent investigations in terrestrial magnetism, and contained all the fundamental facts of the science as they were known at that time. Gilbert establishes the magnetic nature of the earth, which he regards as one great magnet, and discusses variations and the bearing of magnetic phenomena on navigation. He was the first to use the terms 'electric force,' 'electric attraction,' and 'magnetic pole,' and to point out that amber is not the only substance which, when rubbed, attracts light objects, but that the same faculty belongs to the resins, sealing-wax, sulphur, glass, etc. These substances he termed 'electrics,' while the metals and other material which would not exert the force of attraction upon being rubbed he called non-electrics. The publication of his treatise *De Magnete*, which was the first great work on physical science to be published in England, will always be regarded as constituting an epoch in the history of magnetism and the allied sciences. Consult: William Gilbert of Colchester, *On the Loadstone and Magnetic Bodies, and on the Great Magnet, the Earth*, translated by Mottelay (London, 1893), which contains a biographical memoir.

GILBERT, WILLIAM SCHWENCK (1836—). An English dramatist, best known for the comic operas in which he collaborated with the composer, Sir Arthur Sullivan. He was born in London, and took his degree at London University. From 1857 to 1862 he was a clerk in the Privy Council office; in 1864 he was called to the bar of the Inner Temple. He had been a contributor to *Fun* (for which he wrote his well-known *Bab Ballads*) and to other periodicals for several years, when in 1866 he wrote his first play, a burlesque called *Dulcamara*. It was the first of a long list. Among his comedies, after such light pieces as *The Merry Zingara* and others, came *The Palace of Truth* (1870); *Pyg-*

malion and Galata (1871); *The Wicked World* (1873); *Sweethearts* (1874); *Broken Hearts* (1876); *Dan'l Druce, and Engaged* (1877). In 1875 he and Arthur Sullivan began to work together. Their most famous pieces are: *H. M. S. Pinafore* (1878); *The Pirates of Penzance* (1879); *Patience, or Bunthorne's Bride* (1881); *Iolanthe* (1882); *The Mikado* (1885); *The Gondoliers* (1889). All these had phenomenally long runs. In 1891 he published a collection of his songs under the title, *Songs of a Savoyard*, reprinted in 1897 in one volume with the *Bab Ballads*. The *Mountebanks* he produced in 1892 with Alfred Cellier. Since then he has written *His Excellency* and *The Grand Duke*.

GILBERT DE LA PORRÉE, zhél'bar' de là pór'ra', or, in Latinized form, GILBERTUS PORRETANUS (1070-1154). A scholastic theologian. He was born at Poitiers, France, 1070, educated at Chartres, and became Bishop of Poitiers in 1142. He was eminent as a philosopher, but was accused of heresy by Bernard of Clairvaux, and was tried at Rheims (1148). On promising to correct his errors he was allowed to go free. He died at Poitiers, September 4, 1154. His chief work was a *Commentary* on Boëthius on the Trinity, reprinted in Migne, *Patrol. Lat.*, lxiv.

GILBERTINES, gil'bēr-tinz. A religious order which formerly existed in England, where it was founded about 1141 by Saint Gilbert, a native of Sempringham in Lincolnshire. He first established a convent of seven nuns, besides lay sisters, and prescribed for them the Benedictine rule. He intended to place them under the direction of the Cistercians, but when this did not seem practicable he founded a congregation of priests and lay brothers to have the care of the nuns, while dwelling in a separate cloister. To these he gave the rule of Saint Augustine modified by Cistercian discipline. The foundation was confirmed by Eugenius III. in 1146, and at the founder's death in 1189 had thirteen cloisters, of which nine were double, 700 male and 1200 female religious. It continued to flourish, but without extending beyond England, until the dissolution of the monasteries, at which time it numbered twenty-two houses. Consult Graham, *Saint Gilbert of Sempringham and the Gilbertines* (London, 1901).

GILBERT ISLANDS. A British archipelago in Oceanica, situated on the equator and between longitudes 172° and 177° E. southeast of Marshall Islands (Map: Australasia, K 2). It consists of 16 small inhabited islets covering a total area of about 166 square miles. They are mostly low, and contain numerous lagoons. The largest of them are Taputeuca, Arorai, Nonuti, Apama, Maiana, and Maraki. The climate is favorable. The chief product of the group is copra. There are over 35,000 colored inhabitants, mostly uncivilized, but including a number of converts to Christianity. The group was discovered by John Byron in 1765, and one of the islands is called Byron. They came into the possession of Great Britain in 1892.

GIL BLAS, zhél blás. See LE SAGE.

GILBOA, gil-bō'a (perhaps an early corruption of Heb. *gib'ath habba'al*, hill of Baal). The biblical name of a range of hills on the eastern side of the plain of Esdraelon (q.v.). Their height varies from a few hundred to 2000 feet.

The hills were the scene of the death of King Saul and his three sons, after their defeat by the Philistines (I. Sam. xxxi.; II. Sam. i. 6; I. Chron. x. 1-8). The modern name of the hills is Jebel Fuku'a.

GILCHRIST, gil'kríst, ALEXANDER (1828-61). An English biographer, born in London. He studied law at the Middle Temple, and was called to the bar in 1849, but relinquished a legal career for that of a man of letters. His contributions to the *Eclectic Review*, the *Literary Gazette*, and the *Critic* were numerous. His chief work is his *Life of William Blake* (1863), the artist of the "Inventions to the Book of Job," with selections from Blake's writings. He wrote also a *Life of William Etty, R.A.* (2 vols. 1855). He was a friend of D. G. Rossetti, and of Carlyle, to whom he was from 1856 next-door neighbor in Cheyne Row. Consult: *Memoir of Alexander Gilchrist*, prefixed to the second edition (London, 1880) of the *Life of Blake*. See **BLAKE, WILLIAM**.

GILCHRIST, WILLIAM WALLACE (1846—). An American organist, choral conductor, and composer, born in Jersey City, N. J. He studied music under Professor Clarke at the University of Pennsylvania, and afterwards took up the profession of teaching, in which he was eminently successful. From 1873 to 1877 he was choirmaster of Saint Clement's Church, Philadelphia, from which he went to Christ's Church, Germantown, as organist and choirmaster. In 1882 he joined the faculty of the Philadelphia Musical Academy, and in the same year won the prize in composition at the Cincinnati Musical Festival with his *Psalm XLVI.*, written for solos, chorus, orchestra, and organ. Two years before he had won the Mendelssohn Glee Club (New York) prize, with the composition *Autumn Dreaming*. He was conductor of several important Eastern choral societies, and his compositions, particularly for the Church, are very widely known. Other important compositions are: *Song of Thanksgiving*, arranged for chorus and orchestra; a cantata, *The Rose* (1887); and the *Ode to the Sun*.

GILDAS, gil'das, or GILDUS, gil'dūs (?-570). A British historian, known as Saint Gildas the Wise. According to Mommsen, he was born at the end of the fifth or at the beginning of the sixth century; certainly before 504. He spent the last years of his life in Brittany. His *De Excidio et Conquestu Britanniae* was first printed in London in 1525, and has been often reprinted, both in England and on the Continent. This work derives its value mainly from the lack of other sources for the period. Gibbon has described Gildas in a single sentence: "A monk, who, in the profound ignorance of human life, has presumed to exercise the office of historian, strangely disfigures the state of Britain at the time of its separation from the Roman Empire." His narrative extends from the invasion of Britain by the Romans to the author's own time. The best edition of Gildas's work is by Mommsen, in the *Monumenta Germaniae Historica*. The introduction is excellent. For other editions and for secondary works, consult Gross, *Sources and Literature of English History* (London, 1900). See **NENNIUS**.

GILDED AGE, THE. A story by Mark Twain and Charles Dudley Warner (1873), satirizing

politics and society. It introduces the typical character of Col. Mulberry Sellers.

GILDEMEISTER, gil'de-mí'stēr, JOHANN (1812-90). A German Orientalist, born at Klein-Siemen (Mecklenburg). He studied at Göttingen and Bonn; in 1830 became lecturer in Oriental languages and literatures at Bonn, and in 1844 professor there. From 1845 to 1859 he was at Marburg as professor of theology and Oriental literature, and in the latter year accepted the chair of Oriental languages at Bonn. His publications include: *Scripti Sententiæ* (1874); *Esdra Liber Quartus Arabice* (1877); *Idrisii Palæstina et Syria Arabica* (1885); and an edition of the *Meghaduta* and *Crigaratilaka* (1840) of Kalidasa. He was one of the founders of the German Oriental Society.

GILDEMEISTER, OTTO (1823-1902). A German journalist and translator, born in Bremen. In 1850 he became editor-in-chief of the *Weser-Zeitung* of Bremen. He is known for his German renderings of Byron's complete works (1864-65; 4th ed. 1888); of a number of plays of Shakespeare, including the historical ones, for the Bodenstedt edition; of Shakespeare's *Sonnets* (1871); Ariosto's *Orlando Furioso* (4 vols., 1882); and Dante's *Divina Commedia* (1888; 3d ed. 1900).

GILDER, gil'dēr, JEANNETTE LEONARD (1849—). An American journalist and critic. She was born at Flushing, N. Y., October 3, 1849; was connected from 1869 with various newspapers in Newark and New York, was associated with her brother, Richard Watson Gilder, in the editorship of *Scribner's Monthly*, now the *Century*, and since 1881 has been joint editor with her brother, Joseph B. Gilder, of the *Critic*. She has also served as literary correspondent for American and English journals, and written several books: *Representative Poems of Living Poets*; *Pen Portraits of Literary Women* (with Helen G. Cone); *Essays from the Critic* (with Joseph B. Gilder); *Authors at Home*; *The Autobiography of a Tomboy*; and *Taken by Siege*. She has also done original work in the drama and in fiction.

GILDER, RICHARD WATSON (1844—). An American poet and editor. He was born in Bordentown, N. J., February 8, 1844, the son of the Rev. William Henry Gilder, at whose seminary in Flushing, Long Island, he was educated. During the Civil War, while a student of law in Philadelphia, he served as a private in Landis's Battery at the time of the invasion of Pennsylvania. After some experience in editorial work, he, with Newton Crane, founded the *Newark Register*, and later was editor of *Hours at Home*, and afterwards assistant editor of *Scribner's Monthly*, into which the former was merged. In 1881 he succeeded Dr. Holland as editor-in-chief of the latter under its new name of the *Century*, a position which he still holds (1903). Mr. Gilder takes an active interest in all public affairs, especially those which tend toward reform and good government, and is a member of many New York clubs. He was one of the founders of the Society of American Artists, of the Authors Club, and of the International Copyright League; also chairman of the New York Tenement House Commission of 1894. He was first president of the New York Kindergarten Association; vice-presi-

dent and acting president of the City Club of New York; president of the Public Art League of the United States; a member of council of the National Civil Service Reform League; a founder of the Anti-Spoils League; and a member of the American Institute of Arts and Letters. He has published volumes of poems, as follows: *The New Day* (1875); *The Celestial Passion; Lyrics; Two Worlds; The Great Remembrance* (these in one volume); *Five Books of Song* (1894); *For the Country* (a selection, 1897); *In Palestine, and Other Poems* (1898); and *Poems and Inscriptions* (1901).

GILDER, WILLIAM HENRY (1838-1900). An American Arctic explorer, born in Philadelphia, Pa. At the beginning of the Civil War he enlisted in the Fifth New York Infantry (Duryea's Zouaves), subsequently was transferred to the Fortieth, and was mustered out with the rank of captain and brevet major. In 1871-77 he was managing editor of the *Newark Register*, and in 1878-80 was second in command on the expedition of Lieutenant Schwatka in search of the relics of Sir John Franklin. He accompanied the De Long expedition on the *Rodgers* under Captain Berry, and after the burning of the vessel on the western shore of Bering Strait, made a midwinter journey of nearly 2000 miles across Siberia to telegraph to the Government the news of the disaster. He afterwards participated in the search for De Long in the Lena Delta. In 1883 he was in Tonquin during the French-Anamese War, and in 1884 visited the region of the earthquakes in Spain. On his expeditions and travels he was a correspondent of the *New York Herald*. He published *Schwatka's Search* (1881), and *Ice-Pack and Tundra* (1883).

GILDEROY, gil'dër-oi. The romantic hero of a ballad preserved in Percy's *Reliques*, and a veritable character, Patrick of the Clan Gregor, in the annals of Perthshire, who was hanged as a highwayman, with five of his companions, in 1638. It was his boast that he had picked Cardinal Richelieu's pocket, robbed Cromwell, and hanged a judge.

GILDERSLEEVE, gil'dër-slëv, BASIL LANE-NEAU (1831—). A distinguished American classical scholar, born at Charleston, S. C. He graduated from Princeton in 1849, and then studied in Germany at the Universities of Berlin, Bonn, and Göttingen, receiving the degree of Ph.D. from the last place in 1853. Upon his return to the United States he was called to be professor of Greek in the University of Virginia, a position which he held from 1856 to 1876. He was also professor of Latin, 1861-66. In 1876 he was appointed to the professorship of Greek at Johns Hopkins University, which position he continues to hold at the present time. He has been the editor of the *American Journal of Philology* since its establishment, in 1880, and by his own writings has made valuable contributions to the syntax of Greek and Latin and to the history of Greek literature. On his seventieth birthday some of his former pupils, most of them professors in universities, published a collection of their Studies, an octavo volume of more than 500 pages (Baltimore, 1902). He has published numerous works: *A Latin Grammar* (1867, 1894, 1899); *Persius* (1875); *Justin Martyr* (1877); *Pindar* (1885); *Essays and Studies* (1890); *Greek Syntax*, part i. (1900). He received the degree of

LL.D. from William and Mary (1869) and Harvard (1896); D.C.L., University of the South (1884); L.H.D., Yale (1891), Princeton (1899).

GILDING (from *gild*, AS. *gyldan*, from *gold*). The art of covering a surface with a thin layer of gold. There are many processes of gilding, varying with the nature of the substance to be gilded and the kind of effect desired. The different methods, however, may be grouped under the three general classes of mechanical gilding, chemical gilding, and encaustic gilding.

MECHANICAL GILDING consists of applying gold leaf directly to a surface which has been previously prepared by the application of a size. The gold leaf, being placed on the size while it is only partially dry, adheres. Various forms of gold leaf, and various substitutes as well, are used for gilding. There is the genuine deep or reddish gold; pale gold, the paleness being due to a silver alloy; silver leaf, afterwards colored or varnished to imitate gold; and 'Dutch' leaf, a copper alloy having an appearance similar to gold. The gilding material is sold in 'books,' a gold book usually containing 24 leaves, 3 inches square. Several different sizes are also used, of which the commonest are 'old gold size,' a mixture of litharge, linseed-oil, and ochre, and 'water size,' made by dissolving isinglass in boiling water, and adding an equal volume of spirits, and then straining the mixture through silk. Gilding may be applied in this manner to wood, cardboard or paper, textiles, metals, masonry, or ivory. When applied to cards, papers, or textiles, the surface must be rendered non-absorbent by a preliminary sizing of weak glue before the regular gilding size is applied. Before gilding a metal surface it must be painted, to protect the surface from oxidation and decay. Metals, however, are rarely gilded by the mechanical process. Masonry, before being gilded, must be 'satisfied'—that is, its porous surface must be rendered waterproof by a solution of shellac and gutta-percha, in naphtha or some other equally efficacious coating. In gilding ivory a warm size is applied. Plaster of Paris needs several preliminary coats of boiled linseed-oil before the gold size is applied. The object of the preparatory treatment of all surfaces is, of course, to secure a smooth, impenetrable, and permanent surface on which to lay the gold leaf. The leaf is accurately cut the desired shape, and applied to the sized surface by means of special tools. After being carefully brushed, to remove stray fragments, the gilding is given a final coat of specially prepared varnish. Glass is gilded by a special process. The gold sheet is made to adhere to the *back* of the glass simply by moistening it with the breath, the glass having been previously cleaned by a preparation of whiting, rubbed off with silk. The pattern is marked in reverse on the back, and that part of the gold inclosed in the pattern fixed by a coat of Brunswick black or other size. After this has thoroughly dried, the portions not included in the pattern are carefully rubbed off with wet cotton. Where gilt ornaments are to be put on a japanned ground, they are by one method painted with gold size, and gold leaf afterwards applied. By another way, rather more than the space the ornament is to occupy is wholly covered with gold leaf, adhering with isinglass. The ornament is then painted on with asphaltum,

which protects the gold beneath it while the superfluous leaf is being washed away. A little turpentine will then remove the protecting asphaltum so as to display the gilt ornament.

GILEAD, gil'ê-ad (Heb. *Gil'ad*; connected with Ar. *jal'ad*, hard, rough). A mountainous district on the east side of the Jordan, whose boundaries are variously conceived in different portions of the Old Testament. In general, it includes the whole mountain region between the Yarmuk on the north and the Arnon on the south, the eastern boundaries being formed by the desert tablelands of Arabia (the plains of Bashan), and the western by the Jordan. In spite of its name, Gilead is a beautiful and fruitful region. The vegetation is luxuriant, especially in the central part round the brook Jabbok, where forests of oak and terebinth occur. Gilead, in fact, is better provided with water and woodland than any part of Western Palestine. It formerly produced gums and spices. The hills are not very high, and they have broad summits almost like tablelands. The district is well adapted for pasturage (Num. xxxii. 1). Gilead was much exposed to Bedouin raids from the east and other hostile attacks, and its history has much to do with wars. The land was conquered from Sihon and Og, and handed over to Reuben, Gad, and the half tribe of Manasseh (Num. xxi. 21-26; Deut. iii. 16). These tribes held it against the Midianites (Judges viii.), Ammonites (Judges xi. 32; xii. 3), and Syrians (II. Kings ix. 14), but finally lost it to the Assyrians. Tiglathpileser captured the land and carried the inhabitants captives (I. Chron. v. 26). Gilead is also interesting as forming a refuge to which Absalom fled (II. Sam. xiii. 38) when fearing the anger of his father; while subsequently, during the rebellion of Absalom, David found an asylum there (II. Sam. xvii. 27-29). It was in Gilead, likewise, that Ishbosheth, the son of Saul, was proclaimed King by Abner (II. Sam. ii. 8-9). The valiant men of Jabesh-Gilead performed the last rites for the bodies of Saul and his sons after the battle of Mount Gilboa (I. Sam. xxxi. 11-13). Elijah sojourned there (I. Kings xvii. 1), and Jesus made visits to this region. In the wars of the Maccabees Gilead played an important part, and under Roman occupation its natural resources were greatly developed. Among the principal cities were Mahanaim, Succoth, Penuel, Mizpeh, and Jazer; in latter times Pella and Gerasa. A conspicuous mountain (perhaps the Jebel Osha) was known as the mountain of Gilead (Gen. xxxi. 21 sqq.). Consult: Oliphant, *The Land of Gilead* (London, 1880); Merrill, *East of the Jordan* (New York, 1881).

GILES, jilz, SAINT (Gk. *Alydius*, *Aigidios*, Lat. *Ægidius*). A hermit of France and abbot of a Benedictine monastery in the second half of the seventh century. He is said to have been an Athenian of royal descent, from early years distinguished for piety and charity. Annoyed by the publicity to which his reputation as a holy man exposed him at home, he went to Provence about 665, and took up the hermit life in a solitary spot near the mouth of the Rhône, living upon herbs and the milk of a hind which came to his cell at stated hours. Here he was discovered by the King of the Goths, who while hunting followed the hind to the hermit's cave. Reluctantly *Ægidius* consented that a monastery

should be established at the place. He became its first abbot, and held the office till his death.

GILES, HENRY (1809-82). An Irish-American clergyman, lecturer, and essayist. He was born in County Wexford, Ireland, and was educated in the Roman Catholic faith at the Royal Academy at Belfast; but he afterwards joined the Unitarian Church, and held pastorates at Greenock and Liverpool. In 1840 he came to the United States, where he soon became known as a lecturer and essayist of considerable force and originality. He published: *Lectures and Essays* (1845); *Christian Thought on Life* (1850); *Illustrations of Genius in Some of Its Applications to Society and Culture* (1854); *Human Life in Shakespeare* (1868); and *Lectures and Essays on Irish and Other Subjects* (1869).

GILES, WILLIAM BRANCH (1762-1830). An American politician and legislator. He was born in Amelia County, Va.; was educated at Hampden-Sidney and Princeton colleges; studied law with Chancellor George Wythe, and practiced law for several years in Petersburg, Va. In early life he was a Federalist in politics, but association with Jefferson's followers in his native State caused him to change his views, and he was elected to Congress in 1791 as a Republican. During his career in the House, which lasted from 1791 to 1803, with the exception of the session of 1799-1801, he was looked upon as the leader of the extreme Republicans. He signalized his entry into the House in 1791 by actively opposing the proposition for the establishment of the United States Bank. In January, 1793, he made a bitter attack on Hamilton, then Secretary of the Treasury, whom he accused of corruption, and when, after an investigation, Hamilton easily vindicated his acts, Giles ignored the result of the inquiry, and pressed resolutions of censure, which the House refused to adopt. In 1795 he led the opposition to the Jay Treaty (q.v.). In 1798 he was an earnest advocate of the principles of the Virginia Resolutions, joining with Madison, Taylor, and Wilson Cary Nicholas in securing their adoption. From 1799 to 1801 he served in the Legislature of Virginia, and in the latter year returned to Washington. He used the most bitter invectives in his debates, declared that the nation was being undermined by monarchical tendencies, and openly charged the Federalist leaders with being in the pay of Great Britain. On the other hand, no man in the Republican ranks was more thoroughly detested by the Federalists than Giles. He succeeded Wilson Cary Nicholas in the United States Senate in 1804, where he became at once the leading spokesman of his party. He was one of the leaders in pressing the impeachment of Justice Chase (see CHASE, SAMUEL), but voted for his acquittal on a majority of the charges, thus causing a breach which was never healed between himself and John Randolph, the principal manager of the impeachment trial on the part of the House. On the collapse of the Burr conspiracy in 1807, Giles introduced a bill for the suspension of the writ of *habeas corpus*. He secured its passage in the Senate, but it was defeated, through the influence of Randolph, in the House. Another bill introduced by him, which defined treason and provided severe penalties, was superseded in the House by a milder bill of Randolph's. In December, 1808, he introduced his bill for the strict enforcement of the

embargo, which was intended by the severity of its provisions to break down the embargo entirely. From 1809 to 1815 Giles was active in the factional fights within his party, and, with Samuel Smith and Vice-President George Clinton, formed the cabal that eventually drove Gallatin from the Cabinet, hampered the Madison Administration by forcing upon it Robert Smith as Secretary of State, and by opposing its war policy and aiding the Federalists almost disrupted the Union itself. Nevertheless, he was made chairman of the Senate Committee on Foreign Relations in 1811, in which position he was able to force upon Madison several military measures of his own. Being absolutely discredited as a party leader, and distrusted by his colleagues, he resigned his seat in the Senate in 1815. He lived in retirement until 1825, when he was an unsuccessful candidate for the Senate against John Randolph; but two years later (1827) he became Governor of Virginia, and held office until shortly before his death.

GILFIL, gil'fil, Rev. MAYNARD. The hero of George Eliot's *Mr. Gilfil's Love-Story*; a sturdy old country parson who, after a great love and a bitter sorrow in his youth, became a sarcastic, careless, but still kindly old man.

GILFILLAN, gil-fil'an, GEORGE (1813-78). A Scottish critic and essayist. He was born at Comrie, a village in Perthshire, January 30, 1813. Educated at the University of Glasgow and at the Divinity Hall of the Secession Body (afterwards the United Presbyterian Church), he was ordained, in 1836, to the School Wynd Church, Dundee, where he remained till his death, August 13, 1878. His works, in which he displayed wide literary sympathies, are numerous. Among them are: *A Gallery of Literary Portraits* (3 series, 1845, 1850, 1854); *The Bards of the Bible* (1850); *The Martyrs of the Covenant* (1852); *History of a Man*, in part autobiographical (1851); *Night: A Poem* (1867); lives of Scott (1870) and of Burns (1879); and an edition of the *British Poets* (1853-60). He did much to promote popular education, and was a successful lecturer.

GILFLORY, gil-flō'ri, Mrs. GENERAL. A humorous character in Woolf's play *The Mighty Dollar*; a widow, good-tempered, but fiery on occasion, and with a weakness for bad French.

GILGAL, gil'gāl (Heb., circle, referring to the circle of stones marking a sacred spot). The name of three towns mentioned in the Bible. The first and most important was situated to the east of Jericho (Josh. iv. 19), on the border between Judah and Benjamin. It was here that the Israelites first encamped after crossing the Jordan, and appears to have been the headquarters during the war for the conquest of the land (Josh. iv. sqq.). Probably, also this was the Gilgal which appears in the history of Samuel and Saul, and the place where the latter was made King (I. Sam. xi. 14, 15). It has been identified with the modern Birket Jiljulieh. A second Gilgal is referred to in the story of Elijah and Elisha (II. Kings ii. 1; iv. 38). It was not far from Bethel. A third Gilgal occurs in Josh. xii. 23, and perhaps is identical with Jiljulieh, about 30 miles southeast of Tantura.

GILGAMESH, gil'gā-mēsh. The name of the hero in a Babylonian epic, large portions of

which have now been found among the cuneiform tablets constituting the 'brick' library of King Asurbanipal. At first the name of the hero, written ideographically, was provisionally read Izdubar (or Gishdubar), which simply represented the sound of the three signs *iz* (or *gish*), *du*, and *bar*, with which the name was written. The phonetic reading Gilgamesh was discovered by T. G. Pinches in 1890. The Gilgamesh epic consisted originally of twelve tablets, and comprised about three thousand lines. About half of it has been recovered. The epic is a composite production, many of the stories told about Gilgamesh being attached to him merely because he became the favorite hero of the Babylonians, whose adventures acquired great popularity. In the Gilgamesh epic dimmed historical traditions and pure myth are represented in about equal proportions. He is a deified hero. As a hero he is primarily associated with the South Babylonian city Uruk (modern Warka), which he conquers; as a god he is a solar deity who is introduced in incantations and hymns. Gilgamesh is a hero of irresistible strength, and among his adventures is a fight against a tyrant, Khunbaba, who is represented as dwelling in a fortress situated in a grove of wonderful grandeur. This adventure probably recalls some historical event, but in the sixth tablet a mythical element is introduced. Ishtar, the goddess of fertility, has become enamored of Gilgamesh, and offers herself to the hero, who, however, refuses her, and adds insult to injury by reprimanding the goddess for her cruelty to her former lovers. As a punishment, a mighty bull is sent out by Anu, the god of heaven, to kill Gilgamesh, but the latter successfully vanquishes the bull. Thereupon Gilgamesh is smitten with disease and begins a long series of wanderings in search of healing. This disease represents the decline of the year, when the sun (Gilgamesh), removing itself from the earth (Ishtar), is imagined to be deprived of its former strength. Associated with Gilgamesh is another hero, Eabani—a Babylonian prototype of the first man—of whom, likewise, stories were current, some of which were transferred to Gilgamesh. Eabani and Gilgamesh become associates, and the former is also punished by Ishtar and eventually dies, whereas Gilgamesh ultimately finds a remedy that at least partially restores him. In the course of his wanderings he has many adventures. He passes through dangerous regions, encounters scorpion-men and lions before he reaches an ancestor, Pir-napishtim (source of life), who has survived a destructive deluge, and from whom Gilgamesh hopes to learn the secret of eternal life, and also to obtain healing from disease. When he at last encounters Pir-napishtim, the latter tells him the story of the deluge (q.v.), and while Gilgamesh does not learn the secret of immortality, he is healed of his disease and returns to Uruk.

It was formerly supposed that Gilgamesh was the counterpart of the biblical Nimrod, but this theory has now been abandoned. Gilgamesh bears a certain relationship to Samson, and phases of the Gilgamesh epic seem to have passed on to the Greeks and to have been embodied in the Hercules epic. Again, in the legends which cluster in the Orient around Alexander the Great, certain elements have been introduced which can be traced back ultimately to the Babylonian tales of Gilgamesh. Consult: Haupt, *Das babylonische*

Nimrodepos (Leipzig, 1884-92); Jeremias, *Izdu-bar-Nimrod* (ib., 1891); Meissner, *Alexander und Gilgamesh* (ib., 1894); Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898); Jensen, *Keilschriftliche Bibliothek*, vol. vi., 1 (Berlin, 1900).

GILIA (Neo-Lat., named in honor of Felipe Gil, a Spanish botanist). A genus of about 100 species of annual or biennial and a few perennial herbs (mostly western) of the natural order Polemoniaceæ. The species have small, many-colored funnel-shaped or bell-shaped or sometimes salver-shaped five-lobed corollas, and some of the species have become popular in gardens, for which purpose they are well adapted, since they are hardy, prolific of bloom, sturdy, and of simplest culture. The seed is sown in any good soil, usually where the plants are to remain. *Gilia tricolor* is shown on Plate of CALIFORNIA FLORA.

GILIAKS, gil'ŭ-aks. A people of the northern portion of the island of Saghalien, and the coast and lowlands about the mouth of the Amur and Liman. They number some 4500, and are divided into three tribes, with at least two chief dialects. Physically they seem to be a mixed people, one type found among them resembling more the Aino, the other the Tungus; but generally they are brachycephalic, of average height, and well built. Their marriage regulations and their bear festivals are of great interest. The Giliaks, who are a hunting and fishing folk, have been influenced in their house-building and domestic arrangements by the Russians, and in their ornamentation by the Chinese. Brinton (1890) classes them with the Tchuktchis, Koriaks, Kamchatkans, etc.; but Sternberg, who lived several years in this part of Asia, and Laufer, incline to place them as a people apart from all others, in respect of language in particular. Some include them in the so-called 'Paleo-Asiatics.' The Giliaks possess a canoe of the monitor form, which resembles that of the Kootenay Indians of British Columbia. The Amur and the Kootenay rivers are the only regions of the globe where this type is found. Besides the article of Deniker on the Giliaks in the *Revue d'Ethnographie* (Paris), for 1884, the literature about them embraces: Schrenck, "Die Völker des Amurlandes," vol. iii. of his *Reisen und Forschungen in Amurland, 1854-56* (Saint Petersburg, 1881-91); Laufer, "Explorations Among the Amoor Tribes," in *American Anthropologist* (New York) for 1900; and the researches of Sternberg, résumé by Weinstein in the *Verhandlungen der Berliner Gesellschaft für Anthropologie* for 1901.

GILL, gil, or **BRANCHIA**, brāŭ'ki-ā (from Dan. *gjælle*, gill, Icel. *gjöllnar*, gills; connected with Icel. *gil*, Eng. *gill*, ravine). One of the special respiratory paired organs of animals which breathe oxygen dissolved in water. The lowest animals respire directly through the thin body-wall at all parts of the surface, and consequently require no special respiratory organs. In the higher animals, such as the mollusks, the body has become of great size, and has a thick skin for protection, and the skin is often covered by a secreted cuticula or a shell. Under these circumstances, oxygen cannot be taken in at all parts of the body, and there must be special organs for respiration, the essential feature of which is that they shall have a delicate, permeable wall.

The gills are such organs. The gills are, almost without exception, outgrowths of the body-wall, provided with a thin wall, and bathed by water. They contain blood-spaces or blood-vessels, which carry the oxygen from the gills to the tissues, and probably carry carbonic acid back to the gills to be excreted there. All gills, therefore, are physiologically alike, but they are not all homologous. We cannot consequently describe them all from one point of view, but shall have to consider them by classes. Gills have arisen independently in at least four different phyla. And even inside a single phylum the gills are by no means all related. We shall consider in order the gills of worms, mollusks, echinoderms, annelids, arthropods, and chordates.

WORMS, BRACHIOPODS, ETC. The flatworms, roundworms, and rotifers respire over the whole surface of the body; but in the Polyzoa and Brachiopoda, in which the body is more or less incased in a shell, the tentacles, taken together, form a respiratory organ, and may be spoken of collectively as gills. The tentacles are thin-walled and hollow, and their cavities communicate with the general body-cavity, so that the body-lymph may carry oxygen from the gills to the tissues.

MOLLUSKS. These massive animals have to solve a much harder problem in respiration than have the Scolecida. In the lamellibranchiates the foot is surrounded by a double row of tentacles. These remain as distinct straight filaments in a few genera, such as *Nucula*, *Leda*, *Yoldia*, and *Solenomya*; but each filament is reflected, making a knee-bend, so that each series of filaments or 'gills' is double, as in *Anomia*, *Arca*, and the mussels (*Mytilidæ*). The reflected part of each filament may be united with the basal part, and the free end of the reflected filament may grow fast to the body or to the mantle. In the other lamellibranchs the adjacent filaments are united by cross-bars, forming a sort of network. Each filament and connecting bar is hollow; blood courses through it, and receives oxygen from the water that rushes by it on all sides. The mechanism for bringing the water to the gills is simple—water rushes into the mantle-chamber, bathing the gills and penetrating between the filaments as it goes in and out. In the shelled gastropods there is a pair of gills on the right and left of the neck in a few symmetrical species; but in most of the spirally coiled species there is only one gill, and that is on the left side. The gill consists of a finger-like process containing a vessel carrying blood to the tip of the gill, and one carrying it from the gill. In passing from the first to the second vessel, the blood is spread out over numerous thin-walled plates, where it comes in contact with the water. In the naked gastropods respiration occurs chiefly on the whole surface of the body, but sometimes by special finger-like outgrowths. In cephalopods there are either two or four gills, which lie in the mantle-cavity, projecting forward, and are fastened on both sides. The general arrangement is the same as in the gastropod gill, but the capillary absorbing surfaces are much increased in area.

ECHINODERMS. The respiratory organs in the group of echinoderms are not all homologous; for the most part they have the function, as it were, by accident. In the starfishes parts of the outer skin are raised up to form thin-walled

papillæ, which are believed to be respiratory. In the serpent-stars the thin-walled pouches lying next the arms in which the sexual products are thrown serve also for respiration. In the sea-urchins there is a gill at the base of each interradius on the outer edge of the thin membrane about the mouth. The gill is merely a thin-walled sac of the skin, into which the body fluids can flow. In the sea-cucumbers (Holothuroidea) there are special, complicated respiratory organs called the respiratory trees. They arise from the lower end of the food-canal, as great branched sacs extending up into the body-cavity. Water flows into these 'trees' and out of them at regular intervals. The 'trees' are wanting in a few thin-walled sea-cucumbers, such as *Synapta* and a pelagic and a deep-sea form.

ANNELIDS AND ARTHROPODS. The thick-skinned fresh-water annelids need no gills, but the thick-skinned marine ones have usually some special provision for respiration. The swimming feet often have a thin, broad lobe containing blood-vessels, and in a few annelids there are special filiform or branched outgrowths of the feet, which aid in respiration. Since the Crustacea are thick-skinned, nearly all of them have gills. In the lower Crustacea there are respiratory plates (podobranchiæ) attached to the legs, but in the higher forms these leg organs form pyramidal masses with central efferent and afferent vessels leading to and from the hundreds of delicate papillæ of which the gill is composed. The gills are so placed that the blood leaving them goes directly to the heart. The great gills are covered by a special shield, the carapace.

In the merostomes (king-crabs, etc.), the gills are broad, flat, and rounded sacs, like the leaves of a book, forming a file of upward of a hundred on each of the gill-bearing abdominal legs. In the trilobites the gills form triangular expansions of certain of the segments of many of the legs behind the head.

INSECTS. The gills of insects whose nymphs or larvæ are aquatic are called 'tracheal' gills, because they are permeated by fine air-tubes; they are long or flattened, leaf-like filaments attached to the sides or end of the body. Such are the gills of the larvæ of the caddis-flies, and of certain aquatic caterpillars (Paraponyx); those of the nymphs of May flies are broad and leaf-like. In the highly modified nymphs of certain May flies (*Bætica* and *Prosopistoma*), the dense masses of tracheal gills are entirely concealed and protected by projections of the mesothoracic segment, so as to form a true respiratory chamber, to which the water gains access by minute openings. Blood-gills are described by Fritz Müller as certain delicate and tubular processes, into which the blood flows, and which do not contain tracheæ. Müller compares them with the gills of Crustacea; they occur in case-worms. The larva of *Pelotrus*, a beetle, has true blood gills. A few adult insects (*Pteronarcys*, and other *Perlidae*) have tracheal gills arising in tufts on the under side of the thorax. In a dragon-fly (*Euphæa*) the gills of the nymph are retained in the imago. The nymphs of many dragon-flies breathe by rectal gills. Consult Packard, *Text-book of Entomology* (New York, 1898).

CHORDATA. Gills in this group are at least roughly homologous. In all the lower aquatic forms water is taken into the mouth, and forced

out through slits in the neck. The sides of these slits, when the current is strongest, are beset with filaments in which the blood circulates and receives oxygen. The gills may be covered, as in most fishes; or they may stand out from the sides of the body, as is the case in gilled Amphibia. The latter position is a precarious one, for the gills are often bitten off; but they can be quickly regenerated. See ALIMENTARY SYSTEM, EVOLUTION OF; RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF THE.

FISHES. The following remarks are condensed from Professor Owen's *Anatomy of the Vertebrates* (London, 1866-68). In the Cyclostomi, which, if we except the lancelet, constitute the lowest order of fishes, and include the hag and lamprey, the gills are saciform, with external openings, and six or seven in number on each side. Each gill-sac receives its proper artery either from the branchial artery or one of its branches. "The leading condition of the gills in other fishes may be understood," says Owen, "by supposing each compressed sac of a myxine to be split through its plane, and each half to be glued by its outer smooth side to an intermediate septum, which would then support the opposite halves of two distinct sacs, and expose their vascular mucous membrane to view. If the septum be attached by its entire margin, the condition of the gill in the Plagiostomi (sharks, dogfish, rays, skates, etc.) is effected. If the septum be liberated at the outer part of its circumference, and the vascular surfaces are produced into pectinated lamelligerous processes, tufts, or filaments proceeding from the free arch, the gill of an ordinary osseous fish is formed. Such a gill is the homologue, not of a single gill-sac, but of the contiguous halves of two distinct gill-sacs, in the myxines: Already in the lampreys the first stage of this bi-partition may be seen, and the next stage in the sharks and rays; consequently, in these fishes a different artery goes to the anterior branchial surface of each sac or fissure from that which supplies the posterior branchial surface of the same fissure; while one branchial artery is appropriated to each supporting septum or arch between the fissures, as it is to the liberated septum or branchial arch in the ordinary osseous fishes."

The lampreys, myxinoids, sharks, and rays are termed fishes with 'fixed gills,' because in them each supporting septum of the anterior and posterior branchial mucous surfaces is attached to the pharyngeal and dermal integument by its entire outer margin, and the streams of water flow out by the same number of fissures in the skin as those by which they enter from the pharynx. In the osseous and in the ganoid fishes there are 'free gills,' the outer border of the supporting branchial arch being unattached to the skin, and playing freely backward and forward, with its gill-surfaces, in a common gill-cavity, which has a single outlet, usually in the form of a vertical fissure. In the myxinoids (see illustration under HAGFISH) six or seven branchial sacs open on each side, and their outlets are produced into short tubes, which open into a longitudinal canal, directed backward and discharging its contents by an orifice near the middle line of the ventral surface. Between the two outlets is a third larger one, which communicates by a short duct with the end of the œsophagus, and admits the water, which passes from that tube

by the lateral orifices leading into the branchial sacs. These sacs, which are developed from the œsophagus, and which may be regarded as the simplest form of piscine gill, have a highly

ARRANGEMENT OF A FISH'S GILLS.

Fig. 1. Diagram to show the arrangement of the gills in a bony fish, as seen in a horizontal section of the branchial chamber on one side. *gc*, gill-cover; *gs*, gill-slit; *bc*, common branchial chamber; *ba 1* to *ba 4*; first four gill-bearing branchial arches, the first three having a double series of branchial laminae, the fourth having only a single series; *ba 5*, rudimentary fifth branchial arch ('inferior pharyngeal' bone), which carries no gills; *og*, pseudo-branchia or 'opercular gill,' developed on the inner face of the gill-cover. The arrows show the passage of the water through the branchial fissures and out by the gill-slit. Fig. 2. Diagram of a pair of branchial laminae in a bony fish. *e*, branchial arch transversely divided, showing the external groove in which the great vessels run; *a*, branchial artery, giving off branches (*bb*) along the inner edges of the branchial laminae; *c*, branchial vein, receiving branches (*dd*) from the outer edges of the branchial laminae.

vascular, but not a ciliated, mucous membrane, which is arranged in radiating primary and secondary folds, so as to increase the surface. In the lampreys there is a further separation of the respiratory from the digestive tract, for each internal blind duct communicates with a median canal beneath and distinct from the œsophagus.

In all the higher fishes the inlets to the branchial interspaces lie on each side of the gullet, and are equal in number with the interspaces; while, except in the elasmobranchs, there is only one outlet on each side. These outlets vary extremely in size, being relatively largest in the

GILLS OF A PERCH.

Gills and heart of the perch, exposed by the removal of the gill-cover on the left side. *a*, first of the four bony arches which carry the gills (*b br*); *br*, lower edges of the gills on the right side; *b*, heart.

is smallest, as in the eels, blennies, and lophioids, and these are the fishes that survive the longest out of water, except in such cases as the climbing fish (q.v.), in which the branchial apparatus possesses complex labyrinthine appendages. The main object of the gills of fishes being to expose the venous blood, in very thin-walled vessels, to streams of water, the branchial arteries rapidly subdivide into capillaries, which constitute a network in one layer,

supported by an elastic plate, and covered by a tessellated but non-ciliated epithelium. This covering and the capillary wall are so thin as to admit free interchange to take place between the blood, loaded with carbonic acid, on the one hand, and the aerated water on the other. The extent of respiratory surface is increased in various ways, of which by far the most common is "by the production of the capillary-supporting plates from each side of long, compressed, slender, pointed processes, extending, like the teeth of a comb, but in a double row, from the convex side of each branchial arch." The number of vascular plates or lamellae attached to each branchial process has been estimated at 135 in the carp, 700 in the eel, 1000 in the cod, 1400 in the salmon, and 1600 in the sturgeon.

AMPHIBIA. We now pass on to the consideration of these organs in amphibians. In the lower or perennibranchiate members of this order, the gills exist permanently, but in the great majority they are mere temporary organs. In the newt three pairs of external gills are developed, at first as simple filaments, each with a capillary loop, but speedily expanding and giving off looplets. The gill is covered with ciliated epithelium, which loses the cilia before the absorption of the organ, and this takes place after a few days of larval existence. In the larval frog the gills, which are on a simpler plan, diminish about the fourth day, and disappear on the seventh. The parts of the branchial framework which support the deciduous gills never get beyond the cartilaginous stage. They thus readily shrink, and become more internal as the head increases in size. As the gills of the perennibranchiate amphibians in all essential points resemble those already described, it is unnecessary to notice them. See AMPHIBIA; DIPNOI.

GILL, gil, Sir DAVID (1843—). A Scottish astronomer, born in Aberdeenshire. He studied at the University of Aberdeen, and in 1873-76 was director of the private observatory of the Earl of Crawford (then Lord Lindsay) at Dun Echt (Aberdeenshire), in which capacity he organized the transit of Venus expedition sent by Lord Lindsay to Mauritius. In 1877 he organized and conducted an expedition to the Ascension Islands for the purpose of determining the solar parallax through observation of Mars. For the results of this expedition he was awarded the gold medal of the Royal Astronomical Society, and the Valz prize at the Académie des Sciences of the Institut de France. In 1885-96 he executed the geodetic survey of Natal and Cape Colony, and in 1897 organized the geodetic survey of Rhodesia. He was made in 1900 Watson gold medalist of the National Academy of Sciences, Washington, D. C. He urged the desirability of the use of photography in the preparation of catalogues of the stars, and himself photographed the great comet of 1882. His writings include memoirs on *Heliumeter Determinations of Stellar Parallax in the Southern Hemisphere* (in the *Memoirs of the Royal Astronomical Society*, vol. xlviii., 1884), and *A Determination of the Solar Parallax from Observations of Mars at the Island of Ascension* (ib., vol. xlvii., 1881).

GILL, HARRY. See GOODY BLAKE.

GILL, JOHN (1697-1771). A Baptist minister, distinguished for his knowledge of rabbinic literature. He was born at Kettering, North-

amptonshire, November 23, 1697. He spent a short time at Kettering Grammar School, and continued his studies in private. At an early age he began to preach, and was ordained in 1718. In 1719 he became pastor of a Baptist church at Horselydown, in Southwark; in 1757 he removed to a new chapel in Camberwell, near London Bridge, where he remained till his death, October 14, 1771. Gill was a very voluminous author. His greatest work was his *Exposition of the Holy Scriptures* (New Testament, 1746-48; Old Testament, 1748-63). He also wrote a *Dissertation on the Antiquity of the Hebrew Language, Letters, Vowel Points, and Accents* (1767), and many controversial works of merely temporary interest. He was a strong Calvinist. Consult his memoir by Ripon (London, 1816).

GILL, zhél, LOUIS ALEXANDRE GOSSET DE GUINNES (called André) (1840-85). A French illustrator, born in Paris. His first work appeared in *La Lune*, and afterwards appeared in *L'Eclipse*. He excelled in the caricature of portraiture, and the best known of his drawings are the series of "Our Contemporaries" and "Our Deputies." His pictures have been shown at the Salon, his dramas have been played, and his verses have often been reprinted; but it is as a caricaturist of contemporary politics that Gill achieved and maintained his reputation.

GILL, THEODORE NICHOLAS (1837-). An American zoölogist, born in New York, N. Y. In 1865-67 he was librarian of the Smithsonian Institution, in 1866-75 assistant librarian of the Library of Congress, and in 1884 became professor of zoölogy in Columbia University. He was elected a member of the National Academy of Sciences, was appointed an associate in zoölogy in the United States National Museum, and in 1897 was elected president of the American Association for the Advancement of Science. His writings, chiefly on ichthyology, include: *Synopsis of Fresh Water Fishes* (1861); *Arrangement of the Families of Mollusks* (1871); *Catalogue of the Fishes of the East Coast of North America* (1873; part i. of the Report for 1871-72 of the United States Commission of Fish and Fisheries); *Bibliography of the Fishes of the Pacific Coast of the United States to the End of 1879* (1882); *Principles of Geography* (1884); *The Characteristics of the Family of Scatophagoid Fishes* (1891); and *Notes on the Tetradontoidea* (1892). He also prepared with Elliott Coues *Material for a Bibliography of North American Mammals* (1877; in vol. xi. of Hayden, *Report of the United States Geological Survey of the Territories*).

GILL, WILLIAM JOHN (1843-81). An English military engineer and traveler, born at Bangalore, India. He studied at Brighton College and the Royal Military Academy (Woolwich), in 1864 was commissioned a second lieutenant in the Royal Engineers, and in 1869-71 served in India. From 1871 to 1876 he was in England, on duty at Aldershot, Chatham, and Woolwich. In 1874 he contested Hackney, and in 1880 Nottingham, both successfully. His first experience as a traveler was had in 1873, when he accompanied Colonel Valentine Baker in a journey through Persia, during which he executed a survey which contributed much to geography. In 1876 he was transferred to Hong Kong, and in 1876-78 traveled in China and Tibet. For the results of this

journey, comprised principally in a large map and in a memoir published in the *Journal of the Royal Geographical Society*, he obtained the gold medal of that society (1879), and that of the Paris Geographical Society (1880). In 1879 he was appointed assistant boundary commissioner on the boundary between Russia and Turkey, newly established by the Berlin treaty. He was in Egypt in 1881 on special service, and having been sent to cut the telegraph wire which led from Cairo across the desert to Syria, was murdered by Bedouins at Wady Sahr. He published *The River of Golden Sand* (2 vols., 1880); new ed. 1883), a popular account of his journey in Tibet and China.

GILLE, zhél, PHILIPPE EMILE FRANÇOIS (1831-1901). A French dramatist and author, born in Paris. At first he studied sculpture; then he became secretary of the Lyric Theatre (1861). He was on the staff of several Parisian journals, notably the *Figaro*, for which he began in 1869 to write the bibliographical criticisms. Some of these have been collected under the title *La bataille littéraire* (1869-91). He also wrote a number of librettos and ballets and several comedies, such as *Vent du Soir* (1857; music by Offenbach); *Le bœuf Apis* (1865, music by Delibes); *Les charbonniers* (1877); *Yedda*, a ballet (music by Métra); *Nanon* (1884, music by Massenet); the book of *Clarissa Harlowe* for Bizet, who died before completing the opera, and *Camille* (1890). He published a volume of poems *L'herbier* (1887), and *Mémoires d'un journaliste* (1869-76).

GILLEM, gíl'lēm, ALVAN CULLEM (1830-75). An American soldier, born in Jackson County, Tenn. In 1851 he graduated at the United States Military Academy, in 1851-52 served against the Seminole Indians, and during the Civil War was chief quartermaster of the Army of the Ohio in the Tennessee campaign, was appointed colonel of the Tenth Tennessee Volunteers in 1862, and from 1863 until the close of the war, with rank of brigadier-general of volunteers, was active in Tennessee, frequently as commander in expeditions or engagements. For bravery at Marion, Va., he was brevetted colonel, United States Army. At the reorganization of the Tennessee State Government toward the close of the war he was vice-president of the convention (January 9, 1865) for the revision of the Constitution, and sat in the first Legislature elected thereafter. Brevetted major-general, United States Army, and commissioned colonel, United States Army, he was in command of the District of Mississippi in 1867-68, and was prominent in the operations against the Modoc Indians in 1873.

GILLE/NIA (Neo-Lat., named in honor of Arnold Gill, a German botanist). A genus of perennial plants of the order Rosaceæ, natives of the temperate parts of Eastern North America. The roots are used in medicine as a mild emetic, and in small doses as a tonic. There are two species which are often called Indian physic. *Gil- lenia trifoliata*, American ipecac, Indian hippo, dropwort, and *Gillenia stipulacea*, or bowman's root. The plants of this genus grow to a height of about two feet, and on account of their graceful foliage are often planted in shrubberies.

GILLESPIE, gíl-lēs'pí, ELIZA MARIA (known also by her religious name, 'Mother Mary of Saint Angela') (1824-87). After a conventual education at Somerset, Ohio, and Georgetown,

D. C., she entered the Congregation of the Holy Cross (1853), and in 1855 became mother superior of the Academy of Saint Mary, then at Bertrand, Mich., but afterwards removed by her to Saint Mary's, Ind. It is said that she founded not far from thirty academies in various parts of the United States. At the beginning of the Civil War she organized among the sisters a board of hospital nurses, which, with the centre of work at Cairo, Ill., rendered effective service in the care of wounded and sick. Upon the separation of her Order in the United States from the European body, she became mother superior.

GILLESPIE, GEORGE (1613-48). A Scotch Presbyterian clergyman and prominent member of the Westminster Assembly. He was born at Kirkcaldy, near Leith, January 21, 1613. After a brilliant career as a student at the Saint Andrews University he became domestic chaplain to Lord Kenmure, and in 1634 to the Earl of Cassilis, his conscience not permitting him to accept the episcopal ordination which was at that time in Scotland an indispensable condition of induction to a parish. While with the Earl of Cassilis he wrote his first work, *A Dispute Against the English Popish Ceremonies Obtruded upon the Church of Scotland* (1637), which attracted considerable attention, and within a few months all available copies were called in and burned by order of the Privy Council. In April, 1638, soon after the authority of the bishops had been set aside by the nation, Gillespie was ordained minister of Wemyss (Fife) by the Presbytery of Kirkcaldy, and in the same year preached a sermon before the General Assembly at Glasgow, pronouncing so decidedly against royal interference in matters ecclesiastical as to call for remonstrance on the part of the Earl of Argyll, then Lord High Commissioner. In 1642 Gillespie was transferred to Edinburgh; but the brief remainder of his life was chiefly spent in London. Already, in 1640, he had accompanied the commissioners of the peace to England as one of their chaplains; and in 1643 he was appointed to the Westminster Assembly. Here he took a prominent part in almost all of the protracted discussions on Church government, discipline, and worship, supporting Presbyterianism by numerous controversial writings, as well as by an unusual fluency and readiness in debate. He died at Kirkcaldy December 16, 1648. His works were published in Edinburgh (1843-48) with prefatory memoir by Hetherington.

GILLESPIE, GEORGE DE NORMANDIE (1819—). A Protestant Episcopal bishop, born in Goshen, N. Y. He graduated at the General Theological Seminary, New York City, in 1840, and was ordained priest in 1843. He was rector of Saint Mark's Church, Leroy, N. Y. (1841), Saint Paul's Church, Cincinnati (1845), of Zion Church, Palmyra, N. Y. (1851), and of Saint Andrews Church, Ann Arbor, Mich. (1861). In 1875 he was consecrated Bishop of the Diocese of Western Michigan, and in 1877 he became a member of the State Board of Charities and Correction. His published writings include: *The Communion of Saints*; *An Holy Priesthood*; and *The Season of Lent*.

GILLESPIE, WILLIAM MITCHELL (1816-68). An American author, born in New York City. He graduated at Columbia in 1834, and from

1845 was professor of civil engineering in Union College. A forceful and profound scholar, he wrote: *Rome as Seen by a New Yorker* (1845); *The Principles and Practice of Land-Surveying* (1855; 6th ed. 1858); a posthumously published *Treatise on Traveling, Topography, and Higher Surveying* (1871; edited by Staley); and other works.

GILLETT, JIL-LÈT', EZRA HALL (1823-75). An American clergyman and author, born at Colchester (New London County), Conn. He graduated in 1841 at Yale, and in 1844 at the Union Theological Seminary, and from the latter year was pastor of the Presbyterian Church at Harlem, N. Y. In 1868 he was appointed professor of political economy, ethics, and history in New York University. In addition to numerous contributions to theological reviews, he published the *Life and Times of John Huss* (1863-64); a *History of the Presbyterian Church in the United States* (1864; 2d ed. 1875); *The Moral System* (1875); and other works.

GILLETTE, WILLIAM HOOKER (1855—). An American actor and playwright. The son of United States Senator Francis Gillette, of Connecticut, he was born in Hartford, Conn., and studied in the universities of New York and Boston, while applying himself to the theatre. He met with success as an actor in stock companies in the South and West, as well as in Boston and New York, and has written a number of plays of great popularity, to the presenting of which he has in recent years devoted himself on the stage. Among them are *Digby's Secretary* (1884, an adaptation from the German, which was, by compromise, combined with Charles Hawtrey's play, *The Private Secretary*, from the same source); *Esmeralda* (in which he collaborated with Mrs. Burnett); *Held by the Enemy*; *A Legal Wreck*; *Too Much Johnson*; and *Secret Service*. His latest New York success was in his dramatization of Sir Conan Doyle's *Sherlock Holmes*, afterwards presented in London. Consult: Hapgood, *The Stage in America, 1897-1900* (New York, 1901); Strang, *Famous Actors of the Day in America* (Boston, 1900); Clapp and Edgett, *Players of the Present* (New York, 1899).

GILLIE, gill'li (Gael., Ir. *giolla*, lad, man-servant). A Highland attendant; a boy, page, or menial; an outdoor servant, especially one in attendance on persons engaged in hunting or traveling. Formerly, in Scotland, it was the duty of a servant, called a *gillie white-foot* or *gillie web-foot*, to carry his master over brooks or watery places.

GILLIES, gill'iz, JOHN (1747-1836). A Scottish historian and classical scholar. He was born in Forfarshire, and was graduated at Glasgow University. A literary life in London was interrupted for a time by travels on the Continent, when he was tutor to the sons of John, Earl of Hopetoun. In 1793 Gillies was appointed royal historiographer for Scotland. His *History of Greece* (1786), long superseded, was his most popular work. He also wrote *A History of the World* (from Alexander the Great to Augustus, 1807) and published the translations *Orations of Lysias and Isocrates* (1778), *Aristotle's Ethics and Politics* (1797), and *Aristotle's Rhetoric* (1823).

GILLINGHAM, gill'ing-hām. A town in Kent, England, one mile east-northeast of Chat-

ham (Map: England, G 5). It is the centre of a fruit-growing district noted for its cherries. It has interesting archaeological remains. Gillingham fort was built in the reign of Charles I. The Jezreelites, or the New and Latter House of Israel, have a large temple and school at Gillingham, which is their headquarters. Population, in 1891, 27,800; in 1901, 38,900.

GILLIS LAND. A territory in the Arctic regions supposed to be situated in about latitude 81° N. and longitude 36° or 42° E. (Map: Arctic Regions, G 4). It was first sighted by the Dutch navigator Gillis in 1707, and, although many other explorers have claimed to have seen it, it has never been explored.

GILLISS, gil'is, JAMES MELVILLE (1811-65). An American astronomer, born in Georgetown, D. C. He became a midshipman in the navy in 1827. He procured leave of absence in 1833, spent a year in scientific study at the University of Virginia, and continued his studies in Paris. Returning to the United States, he became in 1836 assistant in the Bureau of Charts and Instruments in Washington, and two years later, in a small wooden building belonging to the Navy Department, organized the first working observatory in the United States. He was made a lieutenant in 1838, and for five years conducted at Washington astronomical observations of great value, which were published by the Government in 1846, containing the first catalogue of stars, and being the first report of astronomical observations to be published in America. In 1842-43 he visited Europe to procure the equipment for the new Government observatory at Washington, completed under his direction in 1845. He spent the years 1849-52 in Chile, where he made observations for the determination of the solar parallax, and studied the constellations of the Southern Hemisphere. He observed solar eclipses in 1853 in Peru, and in 1860 on the northern Pacific coast of the United States, and after the departure of Lieut. M. F. Maury at the outbreak of the war, succeeded him as superintendent of the National Observatory at Washington, a position which he held until his death. Under his control the observatory became one of the best equipped in the world. He became a captain in 1862. His publications include: *Astronomical Observations Made at the Naval Observatory* (1846); *The United States Astronomical Expedition to the Southern Hemisphere, 1849-52* (1855). Consult Gould, *Memoir*.

GILLMORE, gil'môr, QUINCY ADAMS (1825-88). An American soldier and eminent military engineer, born at Black River, Lorain County, Ohio. He graduated at West Point, as first in his class in 1849, and was assigned to the Engineer Corps, served as an assistant engineer in the building of Fortress Monroe from 1849 to 1852, and from 1852 to 1856 was assistant instructor of practical military engineering at West Point, where he also acted as treasurer and quartermaster from September, 1855, to September, 1856. From 1856 to 1861 he was stationed at New York, where he was in charge of the Engineer Agency intrusted with the buying and the shipping of materials for fortifications, and in 1857-58 was also in charge of the fortifications in New York harbor. During the Civil War he was one of the ablest military engineers in the Federal service.

He acted as chief engineer of the Port Royal Expeditionary Corps in 1861-62; was chief engineer at the siege of Fort Pulaski, Ga.; from February to April, 1862, was in command during the bombardment and capture of that fort; and on April 28, 1862, was raised to the rank of brigadier-general of volunteers. He then commanded successively the District of Western Virginia (from September 28 to October 14, 1862), the First Division of the Army of Kentucky (October 14, 1862, to January 25, 1863), and the District of Central Kentucky (January 25, to April, 1863), and on March 30, 1863, was brevetted colonel in the Regular Army. From June 12, 1863, to April, 1864, he was in command of the Department of the South, and from July 16, 1863, to June 17, 1864, of the Tenth Army Corps, during which time he conducted the land operations against Charleston, S. C., and participated in the battle of Drury's Bluff, Va., and in the defense of Bermuda Hundred. In July, 1864, he commanded two divisions of the Nineteenth Army Corps in the defense of Washington, and the pursuit of General Early (q.v.). On March 13, 1865, he was brevetted successively brigadier-general and major-general in the Regular Army; and on December 5, 1865, he resigned from the volunteer service. After the close of the war he served as superintending engineer of the fortifications on Staten Island from 1866 to 1869, 1870 to 1882, and 1883 to 1884; of the coast defenses from Cape Fear River, N. C., to Saint Augustine, Fla., from 1869 to 1882, and from 1883 to 1884; and was superintending engineer of surveys of rivers and harbors in North Carolina, South Carolina, Georgia, and East Florida from 1870 to 1882, and again from 1883 to 1888, during which time he was in charge of various river and harbor improvements of importance. He was president of the Mississippi River Commission from 1879 to 1882, was raised to the regular rank of colonel of engineers in February, 1883, and at various times was a member of important engineer boards. In 1876 he was one of the judges at the Centennial Exposition, and presented to the Bureau of Awards able reports on *Portland, Roman, and Other Cements and Artificial Stones*, and on *Brick-Making Machinery, Brick-Kilns, Perforated and Enameled Brick, and Pavements*. He published *Siege and Reduction of Fort Pulaski* (1862); *A Practical Treatise on Limes, Hydraulic Cements, and Mortars* (1863); *Engineering and Artillery Operations Against Charleston, S. C., in 1863* (1865; supplement 1868); *Béton, Coignet, and Other Artificial Stones* (1871); *The Compressive Strength, Specific Gravity, and Ratio of Absorption of Building Stones of the United States* (1876); and *A Practical Treatise on Roads, Streets, and Pavements* (1876).

GILLOTT, jil'ôt, JOSEPH (1800-72). An English manufacturer of steel pens. He first began the manufacture of pens in 1830, and gradually introduced improvements, both in the pen itself and in manufacturing processes, until his pens came to be almost universally used. He accumulated a large fortune, a part of which he expended in getting together a valuable collection of paintings.

GILL-OVER-THE-GROUND. See GROUND-IVY.

GILLRAY, gil'râ, JAMES (1757-1815). An English caricaturist. He was born in London, July,

1757, of Irish descent, but little is known of him until he became a student of the Royal Academy, where he made a special study of art designs. His first engraved works were two plates published in 1784; they were illustrations for Goldsmith's *Deserted Village*. In 1792 he visited France, Germany, and Holland; in the same year he published his well-known caricatures, "John Bull and His Family Landing at Boulogne," and the large plate after Northcote, inscribed "La Triomphe de la Liberté, ou l'élargissement de la Bastille." Gillray has no rival as a caricaturist of the politics and manners of the years 1774-1809. His cartoons represent the fashionable society at Vauxhall Gardens, lords and ladies, singers, soldiers, life at home, in the taverns, in the villages, and in the poor quarter of London among the patient, struggling artisans. His comedy was produced by the strongest contrasts. He was a masterly draughtsman of a vehement style, almost brutal and coarse at times, yet capable of expressing the most delicate feeling and beauty. His caricatures number twelve thousand, and his last work is dated 1811. His death, caused by intemperate habits, occurred in London, June 1, 1815. A satire on an "Irish Fortune-hunter," or "Paddy on Horseback," is the earliest known work, dated 1779; other works are: "L'Assemblée nationale" or a "Grand Co-operative Meeting at Saint Anne's Hill" (1804); "A New Way to Pay the National Debt" (1796); "Temperance Enjoying a Frugal Meal" and a "Voluptuary Under the Horrors of Digestion" (1792); "The Life of William Cobbett. Written by Himself," eight satirical plates (1809); "Elements of Skating," four plates (1805); "Rake's Progress at the University," five plates (1806). Consult: Buss, *English Graphic Satire* (London, 1874); Everitt, *English Caricaturists* (ib. 1885).

GILLS, SOLOMON. A ship's-instrument maker, in Dickens's *Dombey and Son*, and a great crony of Capt. Edward Cuttle.

GILLYFLOWER (ME. *gyllofer*, from OF. *giolfre*, *girofle*, *girofre*, corrupted from ML. *caryophyllum*, from Gk. *καρυόφυλλον*, *karyophyllum*, clove-tree, from *καρυον*, *karyon*, nut + *φύλλον*, *phyllon*, leaf; influenced by popular etymology with Eng. *flower*). A popular English name for some of the cruciferous plants, prized for the beauty and fragrance of their flowers, as wallflower, stock, etc. The clove-pink also, the wild original of the carnation, is called clove-gillyflower. The name is now used mostly for species of the genera *Cheiranthus* and *Matthiola*. Species of the former furnish the different varieties of wallflowers, and of the latter the various kinds of stock. See **STOCK**.

GILMAN, gil'man, ARTHUR (1821-82). An American architect, born at Newburyport, Mass. After his graduation at Trinity College (Hartford, Conn.), he became known as a lecturer on architecture, and as a practical architect, whose chief achievement was the Boston City Hall. From 1865 he was a resident of New York City, where he designed the building of the Equitable Insurance Company. A portion of the State Capitol at Albany, also, is his work. While a citizen of Boston, he was prominent in his endeavors for municipal improvement.

GILMAN' ARTHUR (1837—). An American educator. He was born in Alton, Ill., was educated in Saint Louis and New York, was en-

gaged in banking in New York from 1857 to 1862; and in 1862 removed to Massachusetts, where he gave his attention chiefly to education and religious instruction, and was for some years after 1871 editor of the publications of the American Tract Society. In 1876, together with his wife, he devised a scheme for the collegiate instruction of women that developed into the Harvard Annex. Mr. Gilman was the executive officer, and when in 1894 the Annex became Radcliffe College, he was chosen as its regent, a position which he held for two years. He founded, and in 1886 became the director of, the Cambridge School for girls known as the "Gilman School." Besides contributing to the magazines, he has published: *First Steps in English Literature* (1870); *Boston, Past and Present* (1873); *First Steps in General History* (1874); *Shakespeare's Morals* (1879); *History of the American People* (1883); *Tales of the Pathfinders* (1884); *The Story of the Saracens* (1886); *The Story of Rome* (1886); *The Discovery and Exploration of America* (1887); *The Making of the American Nation* (1887); and *The Story of Boston* (1889); and has edited various compilations.

GILMAN, CAROLINE HOWARD (1794-1888). An American author, born in Boston. She was the daughter of Samuel Howard, and married the Rev. Samuel Gilman. She was widely known as a writer, and some of her works enjoyed at one time a considerable popularity. Among her publications are: *Recollections of a New England Housekeeper* (1835); *Recollections of a Southern Matron* (1836); *Poetry of Traveling in the United States* (1838); *Ruth Raymond* (1840); *Verses of a Life Time* (1849); and, in conjunction with her daughter, Mrs. Jervey, *Poems and Stories by a Mother and Daughter* (1872).

GILMAN, CHANDLER ROBBINS (1802-65). An American physician. He was born in Marietta, Ohio, graduated at the University of Pennsylvania in 1824, and from 1841 until his death was professor of obstetrics and diseases of women and children in the College of Physicians and Surgeons, where, after 1851, he also filled the chair of medical jurisprudence. He published: *Life on the Lakes* (1835); *Sketch of the Life and Character of Dr. J. B. Beck* (1851); and *The Relations of the Medical to the Legal Profession* (1856).

GILMAN, DANIEL COIT (1831—). An American educator, born in Norwich, Conn. He came from a New Hampshire family which migrated from Norfolk, England, in 1638. After graduation at Yale in 1852, he studied and traveled in Europe. In 1855 he entered the service of his alma mater and remained in it until 1872, as librarian, professor of physical and political geography, and secretary of the Sheffield Scientific School. He then was made president of the University of California. In 1875 he was called to the presidency of the newly founded Johns Hopkins University of Baltimore, and retained this office for twenty-five years. After his resignation he was chosen president of the Carnegie Institution of Washington. He also served as president of many educational and philanthropic associations, and received many honorary diplomas. President Cleveland appointed him one of the commissioners to determine the true boundaries of Venezuela; he served as one of the Charter Commission of Baltimore; and was

made president of the National Civil Service Reform League, and of the American Oriental Society. As a member of three boards—the Peabody, the Slater, and the General Education Board—he became active in the promotion of education in the South. His publications include a large number of reports and magazine articles, an introduction to Lieber's minor writings, an introduction to De Tocqueville's *Democracy in America*, a volume of speeches and essays entitled *University Problems*, a small volume on *Science and Letters in Yale*, and a memoir of James Dwight Dana, the geologist. To the American Statesmen Series he contributed a memoir of President Monroe. In 1901 he became one of the three general editors of the *New International Encyclopædia*.—His brother, EDWARD WHITING (1823-1900), was born at Norwich, Conn., graduated at Yale University in 1843, and, after studying theology at the Union Theological Seminary and the Yale Divinity School, became a Congregational minister. For twenty years prior to his death he was corresponding secretary of the American Bible Society, being chiefly concerned with its wide foreign correspondence.

GILMAN, JOHN TAYLOR (1753-1828). An American political leader, Governor of New Hampshire for fourteen terms. He was born at Exeter, N. H., the son of Nicholas Gilman, a Revolutionary leader, and a brother of United States Senator Nicholas Gilman (1755-1814). He was educated at Exeter. The day following the battle of Lexington he marched to Cambridge with the first company of minute-men from New Hampshire, and subsequently served as an aide to his father, who commanded the regiment of New Hampshire troops at the siege of Boston. Later he became assistant to his father, who was Treasurer of New Hampshire from 1776 to 1783. His first political office was that of a member of the New Hampshire Legislature in 1779. He was a delegate from New Hampshire to the convention of New York and the New England States held in 1780 at Hartford, Conn., to devise means for the continuation of the war. In 1782-83 he was a member of the Continental Congress, resigning after a year's service to accept the office of Treasurer of his native State, in succession to his father. In 1786 he resigned the Treasurership to act as commissioner, with John Kean of South Carolina and William Irvine of Pennsylvania, to settle the accounts of the old Confederation with the several States. He was engaged in this work until 1791, when, after another year's service as State Treasurer, he was elected, in 1794, Governor of New Hampshire. This office he held until the close of 1805, and again from 1813 to 1816. In 1812 he was a Presidential elector on the Federalist ticket, and in 1813, in the political upheaval precipitated by the war with England, he was again chosen Governor. He was reelected in the two succeeding years, and, although opposed to the war policy of the National Government, engaged actively in providing defenses for the New Hampshire coast and frontier. He sympathized with the movement that resulted in the Hartford Convention of 1814, but refused to take any action in the matter of sending delegates from New Hampshire, which was therefore represented only unofficially. In 1816 he declined a reelection, and retired to private life. Consult *The Gilman Family* (Albany, 1869).

GILMAN, NICHOLAS (1755-1814). An American statesman, born at Exeter, N. H. He served during the Revolutionary War as adjutant in the First New Hampshire Regiment (Col. Alexander Scammell's), in 1786-88 was a member of the Continental Congress, and in 1787 of the Constitutional Convention at Philadelphia. From 1780 to 1797 he sat in the House of Representatives, and from 1805 until his death in the Senate. He was a distinguished figure in the public life of his time.

GILMAN, NICHOLAS PAINE (1849—). An American author, journalist, and clergyman, born at Quincy, Ill. He graduated at the Harvard Divinity School in 1871, was pastor of various Unitarian churches in Massachusetts from 1872 to 1878, and professor of English literature at Antioch College, Yellow Springs, Ohio, in 1878-81. In the latter year he resumed his pastoral work. From 1885 to 1889 he was assistant editor of the *Unitarian Review*, from 1889 to 1895 was editor of the *Literary World* (Boston), and in 1892 became editor of the *New World*, a Unitarian quarterly. In 1895 he was appointed to the chair of sociology and ethics in the Meadville (Pa.) Theological Seminary. In 1889 he published *Profit-Sharing Between Employer and Employé: A Study in the Evolution of the Wages System*, a work which won universal commendation, was translated into German, and received the award of a gold medal at the Paris Exposition of 1889. His other publications include: *Laics of Daily Conduct* (1891), a non-sectarian text-book of ethics, and *Socialism and the American Spirit* (1893).

GILMAN, SAMUEL (1791-1858). Clergyman and author. He was born at Kingston, Mass., graduated at Harvard in 1811, and in 1819 was ordained pastor of the Unitarian Church at Charleston, S. C., which he continued to serve till his death. He was an active advocate of the temperance cause, and published: *Memoirs of a New England Village Choir* (1829); *Pleasures and Pains of a Student's Life* (1852); *Contributions to Literature, Descriptive, Critical, Humorous, Biographical, Philosophical, and Poetical* (1856); as well as contributions to periodicals and translations of certain of Boileau's satires.

GILMER, gil'mer, GEORGE ROCKINGHAM (1790-1859). An American lawyer and Governor, born at Lexington, Ga. After serving in the State Legislature (1818-20), where he began the agitation that resulted in the establishment of the Supreme Court, he was twice Governor of Georgia (1829-31, 1837-39); a member of Congress (1821-23, 1827-29, 1833-35), and Presidential elector for Hugh L. White (1836), and for Harrison (1840). In 1855 he published *Georgians*, a work containing much information about the early settlers of Georgia.

GILMER, JEREMY FRANCIS (1818-83). An American soldier, born in Guilford County, N. C. He was commissioned second lieutenant of engineers upon his graduation from the United States Military Academy in 1839, and until 1861 was active in making surveys, constructing fortifications, and executing various river and harbor improvements. Upon the outbreak of the Civil War he entered the Confederate service, was appointed major of engineers, and became chief engineer on the staff of Gen. A. S. Johnston. He was wounded at the battle of Shiloh, was

later appointed chief of the engineering bureau at Richmond, and in 1863 was commissioned major-general, Confederate States Army.

GILMOR, gil'môr, HARRY (1838-83). An American soldier, born in Baltimore County, Md. He entered the Confederate Army at the outbreak of the Civil War, was commissioned captain in 1862, in 1862-63 was imprisoned for five months at Fort McHenry, and in 1863 raised a cavalry battalion, of which he was made major. Subsequently he commanded the First Confederate Regiment of Maryland, and in 1864 headed the advance of the forces of Gen. J. A. Early into Maryland. In 1874 he became police commissioner of Baltimore. He wrote *Four Years in the Saddle* (1866).

GILMORE, gil'môr, JAMES ROBERTS (1822-1903). An American writer and editor, born in Boston, Mass. He entered a counting-room in 1836, met with considerable success in business, and in 1847 established in New York City a cotton and shipping firm which did a leading business in several Southern States, and of which he acted as president until 1857, when he retired from commercial life. He early began to write for periodicals, and in 1862, in conjunction with Robert J. Walker, ex-Secretary of the United States Treasury, and Charles G. Leland ('Hans Breitmann'), founded in New York the *Continental Monthly*, a magazine devoted chiefly to the cause of emancipation, his interest in which, however, he relinquished to Walker in the following year, while he himself became an occasional editorial writer on the staff of the *New York Tribune*. In the summer of 1864 he and Col. James F. Jaquess, acting as the unofficial agents of President Lincoln, entered the Confederate lines and proceeded to Richmond, where they laid before President Jefferson Davis various peace proposals, which were immediately rejected on the ground that the South would accept no terms which did not involve the recognition of the independence of the Confederacy. Gilmore's account of this mission, which appeared in the *Atlantic Monthly*, undoubtedly did much to break the ranks of the peace party in the North, and to influence many, who had previously been wavering between Lincoln and McClellan, to cast their votes for the former in the ensuing Presidential election. Gilmore engaged in business again in 1873, but retired ten years later to devote himself wholly to literature. His writings have attained considerable popularity, though his historical works have been much criticised by special students of the subjects treated. His earlier books were published under the nom-de-plume of 'Edmund Kirke.' His writings include: *Among the Pines* (1862); *My Southern Friends* (1862); *Down in Tennessee* (1863); *Adrift in Dixie* (1863); *Among the Guerrillas* (1863); *On the Border* (1864); *Patriot Boys* (1864); *A Campaign Life of Garfield* (1880); *The Rear Guard of the Revolution* (1886); *John Sevier as a Commonwealth Builder* (1888); *Advance Guard of Western Civilization* (1888); *A Mountain White Heroine* (1889); *The Last of the Thorndikes* (1889); and *Personal Recollections of Abraham Lincoln and the Civil War* (1898).

GILMORE, JOSEPH ALBREE (1811-67). An American politician, war Governor of New Hampshire. He was born in Weston, Vt. He had very little schooling, and his early business experience

was obtained in a store in Boston. In 1832 he settled at Concord, N. H., where he became the proprietor of a large grocery store. In 1848 he became interested in railroading, first as constructing agent, and then as general superintendent of the Concord and Claremont Railroad, which position he continued to hold after the road was consolidated with the Manchester and Lawrence, and other connecting roads, until 1866. His political career began in 1858, when he was elected to the New Hampshire State Senate as a Republican. He was reelected in the following year, and chosen president. In March, 1863, he was nominated for Governor by the Republicans, but there was an independent candidate in the field, and no candidate received a majority of votes as required by the State Constitution for an election. The Legislature, however, chose Gilmore, and in 1864 he was reelected by the people. His administration of the office during the most trying period of the Civil War was marked by great energy and firmness, and it was largely through his personal exertions that New Hampshire's contribution to the Union armies was increased from 15,500 to 33,258, an excess of 1800 over the State's quota.

GILMORE, PATRICK SANSFIELD (1829-92). A celebrated American military bandmaster, born near Dublin, Ireland. His first musical experience was with the town band of Athlone, and when but eighteen years of age he left his native city to go to Canada with an English band. Almost immediately on his arrival he crossed the boundary into the United States and settled in Salem, Mass., where he became conductor of a military band. The famous Gilmore's Band (see **BAND**) was organized by him at Boston in 1859, but the Civil War interfered with its full development at that time, its conductor, Gilmore, becoming a bandmaster in the Union Army. During the war he established a brilliant musical record, and in 1864, at New Orleans, gave a magnificent musical festival. His performers were the combined bands of many regiments, which, together with such novel effects as the booming of cannon to emphasize more strongly the musical rhythm, combined to make the festival memorable. The National Peace Jubilee of 1869, and the World's Peace Jubilee of 1872, held on Boston Common, gained him an international reputation. The entire musical ensemble in 1869 consisted of an orchestra of 1000, and a chorus of 10,000 voices, which number was doubled in the festival of 1872. This huge volume was still further reinforced by a powerful organ, artillery guns, bells, and other devices. Commencing with New York, Gilmore and his band began a concert tour which was as popular as it was successful, the tour covering Canada, Great Britain, and several Continental European cities of importance. He published several compositions and arrangements for military bands, but was of far greater importance as a conductor, and for the perfection to which he brought the concert military band organization. His successor in this branch of musical organization was Sousa (q.v.). He died in Saint Louis, Mo.

GILMOUR, gil'môr, RICHARD (1824-91). A Roman Catholic bishop of Cleveland, Ohio, born in Glasgow, Scotland. He was educated at Mount Saint Mary's College, Emmitsburg, Md., and in

1852 was ordained priest. After his consecration as bishop in 1872 he became widely known for his interest in Catholic education. He wrote a *Bible History* (1869), and compiled a series of readings under the name "The Catholic National Readers."

GILOLO, jə-lō'lo, or **HALMAHERA** (native name *Bato-tisma*). The largest of the Moluccas (q.v.) or Spice Islands, situated between latitude 2° N. and 1° S., and longitude 127° 27' and 129° E., east of Celebes (Map: East Indies, G 4). Its area is estimated at over 6300 square miles. It is very irregular in its form, which bears some resemblance to Celebes. The surface is mountainous and the climate tropical. The soil is of great fertility. The island belongs to the Netherlands, and is included in the Residency of Ternate. The chief towns are Galela and Patani. The population is estimated at 120,000, and consists of Malays and Alfuros.

GILPIN, gıl'pın, **BERNARD** (1517-83). An English clergyman, known as the 'Apostle of the North.' He was born at Kentmere, Westmoreland. He studied at Queen's College, Oxford. Soon after graduation he was chosen fellow of his college, and took orders in 1542. On the opening of the new foundation of Christ Church, Wolsey made him one of the head masters. At that time the university was divided on the subject of the Reformation. Gilpin at first took ground against it, but later embraced it. In 1552 he became Vicar of Norton, and was licensed by Edward VI. as a 'general preacher.' He soon resigned his benefice, however, and went abroad and lived at Louvain and Paris. Returning to England during Queen Mary's reign, he found the persecution of the Protestants still in progress. His uncle, Bishop Tunstall, of Durham, gave him the living of Easington and the archdeaconry of Durham, later the rectory of Houghton-le-Spring; protecting him also, notwithstanding his open avowal of Protestant opinions. He devoted himself to the diligent prosecution of his parish work and to itinerant labors through the country. Queen Elizabeth offered him the Bishopric of Carlisle, which he declined. He continued until his death rector of Houghton, residing constantly in his parish except when he visited the ruder parts of the county of Northumberland. The people in certain districts had long led a lawless life, subsisting mostly on plunder. Gilpin went fearlessly among them, and did much to change the character of the country. His chief labors, however, were in his own parish of Houghton, which included fourteen villages. He was a bachelor, and in hospitality resembled the character ascribed to the primitive bishops. Every fortnight 40 bushels of corn, 20 bushels of malt, and a whole ox were consumed in his house, besides ample supplies of many other kinds. He maintained an open table for his people every Sunday from Michaelmas to Easter. The rectory house was also open to all travelers, and so great was the reverence which surrounded him that his liberality was rarely abused. He died at Houghton-le-Spring March 4, 1583. Consult his life by Carleton (London, 1629); also the life by Collingwood (London, 1884). Four of his sermons were reprinted (Houghton-le-Spring, 1835).

GILPIN, **HENRY DILWOOD** (1801-60). An American lawyer. He was born in Lancaster, England, where his father, Joshua Gilpin, a Philadelphia manufacturer and author, was liv-

ing at the time. He was educated in England up to 1816, when he removed to America, and graduated at the University of Pennsylvania in 1819. He was admitted to the bar in 1822, and rapidly established himself in an extensive practice in Philadelphia. In 1832 he was appointed by Jackson to succeed Dallas as United States District Attorney for Pennsylvania, and served until 1837. At the same time he acted as one of the Government directors of the United States Bank, and actively seconded Jackson's radical efforts to destroy that institution. This activity reacted upon him toward the end of the Administration, when the Senate refused to confirm his appointment as Governor of Michigan Territory. In 1837 he was appointed by Van Buren Solicitor of the United States Treasury, and in 1840 he was appointed Attorney-General of the United States, a position which he retained until the inauguration of President Harrison. He never reëntered public life, but spent his remaining years in travel and literary pursuits and in the practice of his profession, and for the next twenty years he was one of the best-known members of the American bar. From 1826 to 1832 he edited the *Atlantic Souvenir*, the first American literary annual. He was a frequent contributor to magazines and reviews. Besides legal reports, he edited *The Papers of James Madison* (3 vols., 1840), and *Opinions of the Attorney-Generals of the United States from the Beginning of the Government to 1841* (2 vols., 1841). He also published: *Biography of the Signers of the Declaration of Independence* (1826); a translation of Chaptal's *Essay on Import Duties and Prohibitions* (1841); and *Life of Martin Van Buren* (1841).

GILPIN, **JOHN**. The hero of a humorous poem by William Cowper (q.v.), first published in the *Public Advertiser*, in 1782. Cowper heard the story from Lady Austen, who in turn had heard it in her childhood. As to the historical reality of John Gilpin, there is a discussion in *Notes and Queries* (London, 2d series, viii., ix., x., 1856; 3d series, ii., 1862; 5th series, ix., 1874; 6th series, i., ii., v., 1880).

GILPIN, **WILLIAM** (1724-1804). An English author. He was born at Scaleby Castle, near Carlisle, and was educated at Oxford. For thirty years he conducted a school at Cheam, Surrey. His works, embracing biographies, descriptions of natural scenery, and religious publications, include: *Lives of Bernard Gilpin, Latimer, Cobham, Huss, Wycliffe, Zisca, Jerome of Prague; Lectures on the Church Catechism* (1779); *Exposition of the New Testament* (1790); and *Remarks on Forest Scenery and Other Woodland Views* (1790).

GIL POLO, hël pō'lo, **GASPAR**. See **POLO**, **GASPAR GIL**.

GILSONITE, gıl'son-it (named in honor of S. H. Gilson, owner of a large deposit of the mineral). An asphaltic mineral, closely resembling grahamite (q.v.), that is found in veins in the Uintah Mountains of Utah. It is black in color, a non-conductor of heat and electricity, and is soluble in carbon disulphide, chloroform, and the heavy distillates of Pennsylvania petroleum. The mineral is utilized in the manufacture of paints and varnishes; in 1900 the production amounted to 3279 short tons. See **ASPHALTIC COAL**.

GILTHEAD (so called from the coloring on its head). A small fish (*Sparus auratus*) of the family Sparidae, to which the scup, porgy, and sheepshead belong. It is numerous on the coast of Europe and Africa, near the shore in small shoals, feeding upon shellfish. The back is silvery gray, shaded with blue; the belly like polished steel; the sides have golden bands; and there is a halfmoon-shaped golden spot between the eyes, from which it derives the name gilthead. This fish was very generally kept in the vivaria of the ancient Romans, being much valued and easily fattened. The name is also given to a British wrasse (q.v.).

GIL VICENTE, zhél vè-sân'tá. See VICENTE.

GIL Y ZÁRATE, hél é thá'r-á-tá, ANTONIO (1786-1861). A Spanish dramatist and literary historian, born in the Escorial. He was educated in France, and upon his return to Spain was employed in the Ministry of the Interior, but was afterwards repeatedly banished from the capital because of his political opinions. He became the editor of several of the opposition journals, and afterwards obtained a State position. His tragedies include: *Carlos II. el hechizado* (1837); *Rodrigo, Don Alvaro de Luna*; and *Guzmán el bueno*. His dramatic works were published in Paris in 1850. He also wrote: *De la instrucción pública en España* (1855); a *Manual de literatura* (1846-84); and some critical studies.

GIMBALS, gim'balz (ME. *gemel*, from OF. *gemeau*, fem. *gemielle*, twin, from Lat. *gemellus*, twin). A contrivance for suspending objects on board ship so that they may remain horizontal or vertical notwithstanding the motion of the ship. As usually fitted, it consists of a ring carrying pivots on its circumference which rest in sockets in a frame or box, and of a second set of pivots on the object (as a compass, or mercurial barometer) which rest in sockets so placed on the inner surface of the ring as to permit an oscillatory motion at right angles to that of the ring.

GIMCRACK, jím'krák, Sir NICHOLAS. The principal character in Shadwell's *Virtuoso*. He affects science, and is an excellent satire on contemporary students of 'natural philosophy,' of the Shaftesbury and Bolingbroke type.

GIMLET. See BORING MACHINERY.

GIMLI, gém'lé (Icel., heaven's roof). In Norse mythology, a great hall at the world's southern end, brighter than the sun. It will stand when heaven and earth have passed away, and good and upright men will inhabit the place to all eternity.

GIMP, or **GYP** (from Fr. *guimpe*, nun's wimple, from OF. *guimpe*, wimple, OHG. *wimpal*, veil, Eng. *wimple*). A kind of trimming for dress, curtains, furniture, etc., made either of silk, wool, or cotton. Its peculiarity is that it consists of a fine wire or cord whipped around and completely covered with fine thread. See LACE.

GIN (from *geneva*, from Dutch *jenever*, from OF. *genevre*, Fr. *genièvre*, juniper, from Lat. *juniperus*, juniper), or **GENEVA**. An alcoholic drink distilled from malt or from unmalted barley or other grain, and afterwards rectified and flavored with juniper-berries. The gin which forms the common spirituous drink of the lower classes of London and its vicinity is flavored

very slightly with oil of turpentine and common salt, each rectifier having his own particular recipe for regulating the quantities to be used. The alcoholic strength of gin, as commonly sold, ranges from 22 to 48 per cent. The amount of sugar varies from 2 to 9 per cent. The larger part by far of the spirit is made in Holland, and is exported to other countries, especially to America and Northern Europe.

GIN, COTTON. See COTTON; COTTON-GIN.

GINAIN, zhé'nán', PAUL RENÉ LÉON (1825-98). A French architect, born in Paris. He studied chiefly under Lebas, and after obtaining the Grand Prix de Rome in 1852 went to Italy, where he executed several important works. He was professor at the Ecole des Beaux-Arts from 1880 until his death. Among the buildings designed and erected by him in Paris are the Church of Notre Dame des Champs, the Lying-in Hospital, the School of Medicine, and several other schools. He received 6000 francs for the excellent design submitted by him during the competitive contest for the architectural plan of the new opera house.

GINATILÁN, hé'ná-tè-lán'. A town of Cebú, Philippines, situated on the western coast, at the mouth of the Rio Ginatilan (Map: Philippine Islands, H 10). It is in a level section, where corn, rice, millet, sugar-cane, tobacco, cotton, cacao, etc., are cultivated; and the forests of the vicinity yield valuable timber. Population, in 1898, 12,144.

GINDELY, gén'de-lé, ANTON (1829-92). An Austrian historian, born and educated in Prague. He was appointed professor at the Oberrealschule in 1853, and at the university in 1862. About the same time he was made archivist for the Kingdom of Bohemia. Besides the important *Geschichte des dreissigjährigen Krieges* (1869-80) not completed, his principal publications include: *Geschichte der böhmischen Brüder* (1856-57); *Rudolf II. und seine Zeit* (1862-65); *Waldstein während seines ersten Generalats* (1886), which provoked violent opposition; and *Ueber des Johann Amos Comenius Leben und Wirksamkeit* (2d ed. 1893). Posthumously appeared *Geschichte der Gegenreformation in Böhmen*, edited by Tupetz (1894), and *Beiträge zur Geschichte des dreissigjährigen Krieges*, edited by Hirn (1900). He also contributed numerous essays to the *Abhandlungen* of the Vienna Academy, and from 1877 to 1892 edited *Böhmische Landtagsverhandlungen von 1526 an bis auf die Neuzeit*.

GINES DE PASSAMONTE, hé'nás dá pás'sá-món'tá. One of the many thankless debtors to the chivalry of Don Quixote, in Cervantes's romance of that name. He is a galley-slave whom the knight sets free and who immediately joins his fellows in attacking their rescuer.

GINEVRA, jé-név'rá. An Italian bride whose tragic fate was commemorated by Samuel Rogers in a poem entitled "Italy." On her wedding day she concealed herself in sport within an oak chest whose spring lock fastened her down. The guests sought for her in vain, and not until years had passed was it discovered how she had met her death. The chest and a portrait of the lady were shown to the poet on his visit to Modena.

GINGER (AS. *gingiber*, OF. *gengibre*, from Lat. *zingiber*, Gk. *ζιγγίβρις*, *zingiberis*, ginger,

from Ar., Pers. *zanjabil*, from Prak. *singabêra*, from Skt. *śrngavera*, ginger), *Zingiber*. A genus of plants of the order Zingiberaceæ, natives of the East Indies. The species, of which there are about twenty, are perennial herbs with annual stems, creeping rootstalks, and leaves in two opposite rows. The flowers are in compact spikes with bracts. The rootstocks of most of the species are used as a condiment and in medicine. The most valuable and generally used are those of the common ginger (*Zingiber officinale*), sometimes distinguished as the narrow-leaved ginger, now cultivated in various tropical countries. In the East Indies this plant has been cultivated from time immemorial; in the West Indies, particularly in Jamaica, from whence the finest quality is derived, and Sierra Leone, from both of which, as well as from the East Indies, its rootstocks—the ginger of commerce—are a considerable article of export. Like the banana and other plants that have long been in cultivation, ginger is grown wholly from cuttings, having apparently lost the ability to set seed. The rootstock is about the thickness of a man's finger, knotty, fibrous, and fleshy when fresh. The stems are reed-like, generally three or four feet high, invested with smooth sheaths of the linear-lanceolate smooth leaves. The flowers are not produced on the leafy stems, but on short scapes in spikes about the size of a man's thumb, and are of a whitish color, the lip streaked with purple. The cultivation of ginger is extremely easy wherever the climate is suitable. In India it is carried on to an elevation of 4000 or 5000 feet on the Himalayas, in moist situations. It may be cultivated at higher latitudes if the rootstocks are taken up and protected during the winter. In harvesting the crop the rootstock is taken up when the stems have withered, and is prepared for the market either by scalding in boiling water—in order to kill it—and subsequent drying, or by scraping and washing. The first method yields black or coated ginger; the second white or scraped ginger; the blackest of black ginger, however, being only a stone color, and the whitest of white ginger very far from perfectly white, unless bleaching by chloride of lime be afterwards employed, as is done not unfrequently to improve its appearance, a process not otherwise advantageous. Ginger found in the shops is sometimes covered with a white coating, usually of lime. This is thought to improve its appearance, but usually covers an inferior grade. There is a considerable difference, however, in the original color of the rootstalks of ginger of different countries, which is supposed to be owing to difference in the varieties cultivated. The uses of ginger, both in medicine as a stimulant and a carminative, and in domestic economy as a condiment, are too well known to require particular notice. The principal constituents of ginger-root are a pale yellow volatile oil called 'oil of ginger,' gingerol, oleoresin, and often as much as 20 per cent. of starch. The yield of oleoresin is from 5 to 8 per cent. Medicinally, ginger is used as a fluid extract, oleoresin, tincture, powder, and in various standard preparations as compound rhubarb powder, etc. Candied ginger, or preserved ginger, consists of the young rootstocks preserved in sugar, and is now exported in considerable quantity from China, as well as from the East and the West Indies. It is a

delicious sweetmeat, and is useful also as a stomachic. Essence of ginger, much used for flavoring, is in reality a tincture prepared of ginger and alcohol. Syrup of ginger is used chiefly by druggists for flavoring. Ginger tea, an infusion of ginger in boiling water, is a domestic remedy very useful in cases of flatulence. Ginger beer is a well-known beverage flavored with ginger. Ginger wine is a cheap liquor flavored with ginger. Ginger was known to the Romans, and is said by Pliny to have been brought from Arabia.

Another species of ginger is zerumbet (*Zingiber Zerumbet*), also called broad-leaved ginger, cultivated in Java, and of which the rootstock is sometimes erroneously called round zedoary. The rootstock is much thicker than that of common ginger, and is less pungent. The rootstock of the cassumunar (*Zingiber Cassumunar*), sometimes called yellow zedoary, has a camphor-like smell, and a bitter aromatic taste. It acquired a high reputation as a medicine in England and throughout Europe about the close of the seventeenth century, but having been extolled not merely as a stimulant and stomachic, but as possessing virtues which did not in reality belong to it, it soon sank into oblivion. The rootstock of the mioga (*Zingiber Mioga*) is less pungent than ginger, and is much used in Japan. Cattle sent to graze in the jungles of Northern India during the rainy season are supplied with the rootstock of a species of ginger (*Zingiber capitatum*), to preserve their health. The root of *Asarum Canadense* is sometimes called Indian ginger or wild ginger in North America, and is used as a substitute for ginger. It has a grateful aromatic odor and taste, and is stimulant, tonic, and diaphoretic. See ASARABACCA; Plate of FLAVORING PLANTS.

GINGER, WILD. See ASARABACCA.

GINGERBREAD-TREE. See DOOM-PALM.

GINGER FAMILY. See ZINGIBERACEÆ.

GING'HAM (probably from Javanese *ging-gang*, perishable, fading; less plausibly from Fr. *Guingamp*, a town in Brittany). A cotton fabric originally introduced from India. It differs from calico in that its colors are woven in and not afterwards printed. At first the Indian gingham consisted of cotton cloths, with two or more colors arranged as a small checkered pattern; now a great variety of designs is found in this material, and in the case of umbrella gingham the whole piece is woven with yarn of one color. Other cotton stuffs, such as zephyrs and chambrays, partake of the nature of gingham.

GIN'GILI. See SESAMUM.

GINGUENÉ, zhân'ge-nâ', PIERRE LOUIS (1748-1816). A French man of letters, born at Rennes. He first came into prominence through his critical articles to the *Mercur de France*, and later by his verses. In 1791 he published *Lettres sur les Confessions de J.-J. Rousseau*, in which he gives high praise to Rousseau. In the beginning of the Revolution he spread the principles of justice and of liberty in his paper, *La Feuille Villageoise*; but when his paper criticised the ensuing excesses Ginguéné was imprisoned. As Director-General of the Commission of Public Instruction, he aided greatly in the reorganization of popular education from 1794 until 1798, when he was appointed by the Directory

GINKGO AND KENTUCKY COFFEE TREE

KENTUCKY COFFEE TREE (*Gymnocladus Canadensis*).

GINKGO TREE (*Ginkgo biloba*).

Minister Plenipotentiary to Sardinia. Meanwhile he had been contributing to the *Histoire littéraire de la France* (begun by the Benedictines). The last years of his life were devoted to literature, his ablest work being his *Histoire littéraire de l'Italie*; second edition by Daunou (14 vols., 1824-35).

GINKEL, gîŋ'kel, or **GINCKELL**, GODART VAN (1630?-1703) first Earl of Athlone. A Dutch general in the English Army. The eldest son of Godard Adriaan van Reede, Baron Ginkel, he was born at Utrecht about 1630. He was trained for the army, and in 1688 accompanied William of Orange to England. The following year he distinguished himself in the capture of a mutinous Scotch regiment at Sleaford, Lincolnshire, and in 1690 went to Ireland with the King, and was conspicuous in command of a body of Dutch cavalry at the battle of the Boyne. He was left as general-in-chief when William returned to England. He captured Ballymore, reduced Athlone, defeated Saint Ruth at Aughrim with terrible slaughter, marched on Galway, which capitulated, and completed the conquest of Ireland by taking Limerick. His return to London through England resembled a triumphal progress. He received the thanks of Parliament, and was created Baron of Aughrim and Earl of Athlone. He continued in the English service, and in 1692 accompanied William to the Continent. He was present at the battle of Landen and assisted in the destruction of the French magazines and stores at Givet. At the renewal of hostilities in 1702 he commanded the Dutch troops under Marlborough, but before the campaign had proceeded far, died, after two days' illness, at Utrecht, February 11, 1703.

GINKGO, jîŋk'gô (Japanese, from Chinese *yin-king*, silver apricot, from *yin*, silver + *king*, apricot). A genus of plants represented by a single living species, which is the sole survivor of an important ancient group of gymnosperms known as the Ginkgoales. The *Ginkgo biloba*, or *Salisburya adiantifolia*, as it is sometimes called, is the well-known maidenhair-tree of cultivation, a popular name suggested by the fact that the leaves resemble those of the ordinary maidenhair fern (*Adiantum*). It has been cultivated for centuries in China and Japan as a sacred tree in connection with temple groves, and it has become common in ornamental cultivation in all civilized countries. It was supposed to be unknown in the wild state until its recent discovery in certain forests of Western China.

The tree has the general habit of a conifer, with central shaft and wide-spreading branches. It is recorded that it sometimes reaches a height of nearly 100 feet, and a trunk circumference of more than 25 feet. The characteristic leaves have long and slender petioles, with broad, wedge-shaped, and variously lobed blades, and a distinctly forking vein system. The leaves are also deciduous, a very rare habit among gymnosperms. The spore-bearing organs—that is, the stamens and ovules—are borne upon short, spur-like shoots, the stamens being in loose, catkin-like clusters, while the ovules usually occur in pairs at the summit of a long stalk. As a rule but a single one of the pair of ovules develops into the mature seed, a development which occurs whether fertilization takes place or not.

Until recently ginkgo was included among the

conifers, but further knowledge of its structure has caused it to be set apart as a group by itself, equal in rank to Cycadales, Coniferales, and Gnetales, the other three living groups of gymnosperms. Prominent among the recent discoveries in connection with ginkgo has been the discovery of ciliated (hence motile) male cells, identical in general character with those discovered in the Cycadaceæ (q.v.). The embryo is an exception among gymnosperms, since it does not develop the usual suspensor, but the fertilized egg directly produces the embryo proper. As in the cycads, the embryo develops two cotyledons, and between them there is a very conspicuous plumule (shoot-bud). Ginkgo also shares with cycads the feature that its seed becomes plum-like, a testa with fleshy outer and stony inner layers being organized. Often without pollination, and hence, of course, without fertilization, the seed attains its usual size, and the two layers of the testa are developed. The starchy kernel of the seed has an almond-like flavor, and is eaten, after slight roasting, by the Chinese.

The ginkgo was introduced into the United States toward the close of the eighteenth century, and, because of its symmetrical shape and freedom from attacks of injurious fungi and insects, it has come into favor as an ornamental and street tree. It is hardy as far north as Massachusetts, and at Washington, D. C., it grows quite well, several streets being planted with this species. Where employed as a street tree, only staminate specimens should be planted, so as to escape the annoyance of the falling disagreeable smelling fruits in autumn.

Ginkgo is a very ancient genus, since it probably grew during Carboniferous time. An ancestral type, with lobed leaves, *Ginkgophyllum*, has been found in the coal measures of Great Britain and in the Permian deposits of the Ural. The genus *Ginkgo* itself has been found in the Permian and Jurassic rocks of Northern Europe and Australia, and it enjoyed an almost universal distribution during Tertiary time. Several allied genera, *Baiera*, *Rhipidopsis*, *Dichranophyllum*, and *Trichopitys*, have been described from those formations.

GINNUNGAGAP, gîn'noong-â-gâp'. See BURI.

GINSENG, jîn'seng (Chinese *jin-tsang*, likeness of a man; less probably, first of plants). The yellowish root of *Panax ginseng*, highly esteemed as a medicine by the Chinese, who believe that it possesses extraordinary virtues for all diseases, particularly for exhaustion of body and mind. Specimens resembling the human form are sometimes sold for their weight in gold. This species, which is a native of China and adjoining territory, is from one to two feet tall, has five almost smooth leaves, with long petioles, between which arises the long-stalked umbel of inconspicuous flowers which are succeeded by numerous scarlet berries. It is cultivated in China and Korea. A description of this species and its properties led to the discovery in 1716 of the American species *Panax quinquefolium*, which so closely resembles Asiatic ginseng that an extensive export trade of wild roots soon followed its introduction in China. Its natural range is from the borders of the Mississippi eastward: in the Southern States it is almost confined to the highlands and the mountains. The Northern root is considered of superior quality

and commands the highest prices. The decreasing supply of wild ginseng has been insufficient to meet the demand, and the price has risen from 52 cents in 1858 to \$5.55 in 1902. This state of affairs has led, in various localities, to many experiments in growing ginseng, all of which failed until about 1885, when George Stanton grew the plant in beds in the forest at Apulia, N. Y. He later succeeded in growing it under an artificial shade of lath. Since the publishing of his methods interest in the plant has increased, and many beds have been set out. The small quantities of cultivated root so far marketed have commanded 20 per cent. or more in advance of the price paid for wild roots gathered in the same district. Ginseng succeeds best in well-drained, loose, friable loam, rich in humus, potash, and phosphoric acid, but not in nitrogen. In its present state of development the root requires about five years to reach marketable size, but at \$2.50 a pound it should more than pay the expenses of growing. So great is the interest in the crop that the introduction of improved varieties is highly probable. The exorbitant prices paid for seeds, young plants, and for the dried root during the years 1898-1902, it seems, cannot persist, since they are due partly to over-appreciation of the Chinese demand for the root, to speculation, and to the newness of this plant as a cultivated crop. Two fragrant aromatic species, *Panax fruticosus* and *Panax cochleatus*, natives of the Moluccas, are used in India as medicine. In European and American practice none of these species are employed to any extent. Consult Kains, *Ginseng* (New York, 1903).

GINTL, gën'tl, WILHELM FRIEDRICH (1843—). An Austrian chemist, a son of the physicist Julius Wilhelm Gintl. He was born and educated in Vienna, and was appointed professor of chemistry at the German Polytechnic Institute in Prague in 1870. In 1878 he became a member of the Bohemian Diet, and retained this position until 1889. He was the founder and first president of the Austrian Society for the Promotion of Chemical Industry. He became widely known through his *Studien über Crookes strahlende Materie und die mechanische Theorie der Electricität* (1880). He was editor of the department of chemistry in the *Technologisches Handwörterbuch* of Karmarsch and Heeren (1874-94).

GIOBERTI, jô-bär'tê, VINCENZO (1801-52). An Italian philosopher and statesman, born in Turin. Educated in the Church, he obtained his degree of doctor of theology in 1823, and was ordained to the priesthood in 1825. He was subsequently appointed professor of theology in the university of his native city, and on the accession of Charles Albert was selected as chaplain to the Court, an office which he filled till 1833. At this period of rising political agitation Gioberti was accused of promoting the liberal movement, was dismissed from Court, and suffered an imprisonment of four months. As another indignity his name was stricken from the list of doctors of theology on the ground that through his teachings he was a corrupter of youth. He then went to Paris and shortly after to Brussels, where he spent eleven years as private tutor in an academy, pursuing in his leisure hours his private studies. Gioberti looked upon the Papacy as the divinely appointed

agency for the elevation of Italy among the nations. A confederation of States subject to Papal arbitration, and having in the King of Piedmont a military protector, was the scheme devised by Gioberti for the unity and regeneration of his country. These views he elaborately developed in his work entitled *Del primato civile e morale degli Italiani* (1843). The liberal and conciliatory policy adopted by Rome on the accession of Pius IX., a warm admirer of the *Primato*, appeared as the verification of Gioberti's predictions and increased the popularity of his name. On his return to Italy in 1848 he was received with ovations from all classes of the people, and was chosen by several towns as their representative in Parliament. The King appointed him Senator; he subsequently was elected president of the Chamber of Deputies, and in December, 1848, became Prime Minister; but, owing chiefly to the failure of his attempt to bring about an agreement between the Pope and the Grand Duke of Tuscany, he held office for only two months, and was forced to resign. His successor dispatched him to Paris on some unimportant mission, and thus ended Gioberti's political career.

From that period he devoted himself exclusively to literary pursuits in Paris, where he died October 26, 1852. As a politician Gioberti aimed ever at the glory and aggrandizement of his country, but failed in far-sightedness, and with the course of events in Italy his influence as a political guide inevitably declined; but the depth and range of thought and strength of conviction evinced in his various works entitle him to the consideration and standing which, as a writer, he enjoys. Gioberti's remarkable gentleness in private intercourse bore no trace of the energetic force with which his writings propound an opinion or denounce an opponent. His chief writings, besides the *Primato*, are: *La teorica del soprannaturale* (1838); *L'introduzione allo studio della filosofia* (1840), which sums up his philosophical system, best stated in the proposition, 'The end creates the existence'; the *Lettre sur les doctrines philosophiques et politiques de M. de Lamennais* (1841); the treatises *Del bello* (1841) and *Del buono* (1843); the *Prolegomeni al Primato* (1845), an open attack upon the Jesuits, whom he had covertly assailed in the *Primato*; *Il Gesuita moderno* (1847), a second attack upon the Jesuits, who had replied to his *Prolegomeni*; *Del rinnovamento civile d'Italia* (1851), advocating unity of the Italian States, national independence, and suppression of the temporal power of the Pope, and forecasting the future greatness of Cavour. There appeared posthumously (1855-63) the *Riforma cattolica della Chiesa*, the *Filosofia della rivelazione*, a large part of his correspondence, and several other works. Consult: Berti, *Di Vincenzo Gioberti, riformatore politico e ministro* (Florence, 1881); Spaventa, *La filosofia di Gioberti* (Naples, 1863); Mauri, *Scritti biografici* (Florence, 1876); Zanichelli, "La giovinezza di Vincenzo Gioberti," in *Studi politici*, etc. (Bologna, 1893).

GIOBERTINE (jô-bër'tin) **TINCTURE**. A preparation for restoring writings or paintings which have from age become illegible. In some cases the process has recovered documents which have been partially expunged, and the parchment written over. (See PALIMPSEST.) The inventor

of it was Giovanni Antonio Gioberti, an Italian chemist (1761-1834), a native of Piedmont, secretary of the Society of Agriculture at Turin, and professor in the university in that city.

GIOCONDO, jò-kòndò. FRA GIOVANNI (c.1450-1515). An Italian architect, engineer, and antiquary, born at Verona. He was a Franciscan friar, studied archaeology in Rome, and made a remarkable collection of some two thousand ancient inscriptions which he presented to Lorenzo de' Medici. He was the designer of the fortifications of Treviso and of works to prevent the silting up of the lagoon of Venice. He was architect to Ferdinand, King of Naples (1489), and when Naples was taken by the French in 1495 he went with Charles VIII. to France, where he is said to have built the Pont Notre Dame, the Hotel Dieu, Chambre de Comptes, and other works. After his return to Italy the Pope appointed him (1513) architect of Saint Peter's; he succeeded Bramante, and was a co-laborer with Raphael and Giuliano da San Gallo. He is generally and with good reason believed to have designed the elegant Palazzo del Consiglio at Verona, though this may have been erected from his designs during his absence in France. He was proficient in philosophy, theology, and classical literature, wrote notes on Caesar's *Commentaries*, and published a critical edition of Vitruvius (1511).

GIOJA, jò'yá, FLAVIO. An Italian navigator of the fourteenth century, born at Pasitano, near Amalfi. He was long regarded as the inventor of the compass, but it is probable that he merely contributed to perfect the instrument and to make it available for navigation.

GIOJA, MELCHIORRE (1767-1829). A famous Italian publicist, born at Piacenza. He was educated for the priesthood, but later studied at Pavia, withdrew from the clergy, and in 1799 was appointed by the French Government director of the statistical bureau at Milan. He was among the first investigators to apply broadly statistics to questions of political economy and public morality. Some of his chief works are: *Sul commercio dei commestibili e care prezzo del vitto* (1804); *Nuovo prospetto delle scienze economiche*; and *Filosofia della statistica*.

GIOJA DEL COLLE, jò'yá dèl kòl'lá. A city in South Italy, 38 miles northwest of Taranto (Map: Italy, M 7). It markets grain, wine, almonds, and wool, and in May and September important cattle fairs are held there. Population of commune, in 1881, 16,573; in 1901, 21,721.

GIOJOSA JONICA, jò-yò'sá yò-nè'ká. A city in the Province of Reggio di Calabria, Italy, 10 miles northeast of Gerace (Map: Italy, L 9). The centre of the town is three miles from the railway station and from the Ionian Sea. It markets grain and olives. Population of commune, in 1881, 9800; in 1901, 10,247.

GIOLITTI, jò-lét'tà. GIOVANNI (1843-). An Italian statesman. He was born at Mondovì in the Province of Cuneo, and was educated at Turin. After serving for eight years in a department of the Ministry of Finance, in which he was appointed chief inspector in 1874, he was elected to the Chamber of Deputies. In 1889 he became Minister of the Treasury, and, in the following year, Minister of Finance, which position he was soon afterwards compelled to

resign because of his policy of extreme economy. After the fall of Rudini, whose financial policy he had stoutly opposed, Giolitti became President of the Ministry, in May, 1892, and, although constantly antagonized by the Chamber, succeeded in introducing many needed reforms in favor of the lower classes. In 1893 he was compelled to resign in consequence of his proceedings against the *Banca Romana*, and was succeeded by Crispi. During his term of office he displayed considerable administrative ability, and aimed consistently to lighten the burdens of the lower classes.

GIORDANI, jòr-dá'nè, PIETRO (1774-1848). An Italian author, born at Piacenza. He joined the Benedictine Order in his youth, but afterwards left it to become secretary of the Academy of Bologna (1808). His liberal political views caused him to be deprived of this post, and exposed him to persecutions at Piacenza, Florence, and Parma. His writings are numerous, and consist largely of critical essays, eulogies, and memorial addresses and political pamphlets. They were written in the best Italian prose of their day, and have since ranked as classic. One of Giordani's claims to fame is the fact that he was the first to recognize the genius of Leopardi. Giusti, Manzoni, Monti, Canova, and Capponi were also his friends. The most valuable of his writings is the collection of letters, *Epistolario*, published with the *Opere*, edited by Gussalli and Vassalli (Milan, 4 vols., 1854-62). Consult also Romani, *Della vita e delle opere di Pietro Giordani* (Mantua, 1868).

GIORDANO, jòr-dá'nò, LUCA, called FA-PRESTO (1632-1705). An Italian painter, born in Naples. He was the son of an inferior painter who continually urged him on at his work, saying, "Luca, work quickly." Thus the boy acquired the nickname of Fa-Presto. He painted with such facility that at the age of thirteen the Viceroy of Naples placed him under the instruction of Giuseppe Ribera. When still young he went to Rome, where he made many copies of the pictures by the great masters. There he was much employed by Pietro da Cortona to assist in his numerous contracts. He afterwards visited Venice and studied the works of Titian and Paul Veronese; later, on his return to Naples, he was fitted to undertake important work. Throughout his life he never lacked patronage. In 1679 he was invited to Florence by the Grand Duke Cosimo III. There he decorated with frescoes the cupola of the Corsini Chapel, later the Galleria Ricardi with a fresco of Olympus. In 1678 he executed an immense picture to commemorate the peace between France, Spain, and Holland, and the following year in Florence he painted in the Chapel of Saint Andrea Corsini. In 1690 he was invited to Spain by Charles II., and appointed painter to the King and made a knight. He painted some of his best frescoes in San Lorenzo del Escorial in the grand staircase representing "The Battle of Saint Quentin" and "The Taking of Montmorency." He also decorated other churches and palaces at Madrid and Toledo. After the death of Charles II. Giordano continued in the service of Philip V., and in 1702 he accompanied that monarch to Naples and was received with great enthusiasm. So great had now become his power of painting rapidly that it is said he painted for the Jesuits a picture of

"Saint Francis Xavier Baptizing the Indians," now in the Museum of Naples, in a day and a half. In like manner he completed the frescoes of the Tesoro di San Martino, Naples, representing the "Story of Judith," in forty-eight hours.

He painted an incredible number of pictures; all the chief galleries of Europe are well supplied with them. Madrid has a great number, and there are many others at Dresden, Vienna, Naples, and Munich. His earliest works are in the manner of Ribera, but by far the greater number are in a style formed under Pietro da Cortona. He possessed ready invention. His color is harmonious and his brush-work good; but his pictures were negligently executed. Among his best works, besides those mentioned above, are "Venus and Mars," in the Louvre; the "Judgment of Paris," in Berlin; "David with the Head of Goliath," and "Lot and His Daughters," at Dresden; "Massacre of the Innocents," Munich; "The Archangel Michael," Vienna, etc.

GIORGIO, jôr'jô, FRANCESCO DI (1439-1502). An Italian architect, engineer, sculptor, and painter, remarkable for his versatility, which makes him prominent among the artists of the Renaissance. He was born in Siena, where (after 1463) he did constructive work, especially in connection with fortifications. From 1478 he was in the service of the Duke of Urbino as military architect and engineer. In 1480 he was commissioned to construct the model for the dome of the cathedral at Milan, executed in 1493 by Giovanni Antonio de Gessato. The invention of mines at the Siege of Naples in 1495 is attributed to him. As a sculptor he may be judged by the figures in the Loggia dei Nobili, and the angels bearing candelabra in the cathedral at Siena. In painting he was a pupil of Vechietta, and imitated Fra Filippo Lippi, to which his graceful pictures in the Siena Gallery bear witness. He wrote a *Trattato di architettura civile e militare*, edited by Cesare Saluzzo in 1841.

GIORGIONE DA CASTELFRANCO, jôr-jô'nâ dâ kâ'stêl-frân'kô (c.1478-1511). One of the chief Venetian painters of the High Renaissance. His real name was **GIORGIO BARBARELLI**, the name Giorgione ('Big George') having been given him because of his ability. He was born at Castelfranco, near Treviso, in 1478, or perhaps earlier. Of his life little is known, except what Vasari relates: that he was of humble origin, and was brought up in Venice; that he was beautiful in person and of great social charm: a fine musician, singing perfectly to the lute; that he was an ardent lover and died in consequence of a love affair. Vasari's statements, however, are founded on hearsay of a later date. We know from other sources that Giorgione was a pupil of Giovanni Bellini (q.v.); he may, indeed, have been influenced by the lights and shades of Leonardo, as Vasari states. Before 1505 he executed commissions for Tuzio Costanzi, a Venetian condottiere, at Castelfranco. About 1505 he returned to Venice, where he decorated the façades of some half-dozen palaces, long since defaced. The most important of these decorations was that of the Fondaco dei Tedeschi (1508). He painted, moreover, a large easel-picture for the audience chamber of the Doge's palace, also lost. He died at Venice in 1511, at the zenith of his popularity.

In such a short life he could have executed but few of the 150 paintings attributed to him in the European galleries. Of unquestioned authenticity, supported by documentary evidence, are the three following paintings: (1) The altarpiece of the Cathedral of Castelfranco, a "Madonna Enthroned Between Saints Liberale and Francis," one of his earliest works; (2) "La Familia di Giorgione," a beautiful landscape containing idealistic figures of a young man, said to be Giorgione, with his wife and child; (3) "Three Eastern Sages," also called "Surveyors" or "Astrologers."

Critics are, for the most part, agreed in ascribing to his early period two small richly colored pictures in the Uffizi, Florence: "Moses and the Burning Bush," and "The Judgment of Solomon," and besides the "Madonna with Saints Anthony and Roch," catalogued as a Pordenone, in the Madrid gallery. Of a later period is the "Concert Champêtre," in the Louvre. Of the many portraits ascribed to him the "Knight of Malta," in the Uffizi, and the "Man in a White Costume," at Rovigo, are certainly genuine; the "Two Men," in the Berlin Museum, and the "Young Man," in the gallery at Budapest, are probably also genuine.

Among other works rightly ascribed to Giorgione are: "Christ Bearing the Cross," owned by Count Loschi, at Vicenza; "Apollo and Daphne," in the Archbishop's Seminary, Venice; the "Three Ages of Man," in the Pitti Palace, Florence; and, especially, the "Sleeping Venus," in the Dresden gallery, formerly considered a copy from Titian. This last picture is probably the most perfect representation of Venus in the art of the Italian Renaissance, and is the prototype of other representations of this subject by Venetian artists. Morelli was the first to ascribe it to Giorgione, but he rejects the "Concert," in the Pitti Palace, usually ascribed to him, although it is a picture of the greatest charm. Many other pictures are attributed to Giorgione in European galleries, and especially in the English, but most of these are not genuine.

Vasari long ago pointed out that Giorgione's position in Venetian art was like that of Leonardo in Florentine art. More than any other he contributed those elements which brought about the highest development of Venetian painting. Before his time, detail was the main consideration, but he strove after the general effect. He introduced that form of picture in which genre figures appear in a beautiful landscape—a characteristic of Venetian art. The subjects of his paintings, religious or otherwise, were subordinated to the idea of representing happy and beautiful life. Although not so great a technician as Titian, his drawing is good, and his color is bright and harmonious; a rich golden tone pervades his pictures. His chief pupil was Sebastiano del Piombo (q.v.), and he also exercised great influence upon Titian and Palma Vecchio.

BIBLIOGRAPHY. The chief authority on Giorgione is Morelli, who has done more than any one else to identify his work. Consult: *Italian Painters*, vol. ii. (London, 1892). Compare also Crowe and Cavalcaselle, *History of Painting in Northern Italy* (London, 1871); Conti, *Giorgione* (Milan, 1894); Gronau, *Zorzon da Castelfranco* (Venice, 1894); Lücke, in Dohme, *Kunst*

GIOTTINO, jôt-tè'nô (1324-57). An Italian painter, of the school of Giotto, called Giotti di Stefano, to distinguish him from his greater predecessor. He was employed to decorate the Vatican Palace at Rome in 1369, with other Giottesque masters (Gaddi and Giovanni da Milano). A "Deposition," in the Uffizi; a "Crucifixion" and "Adoration," in the Strozzi Chapel at Santa Maria Novella; and the legend of Constantine and Pope Sylvester at Santa Croce in Florence, are attributed to him. He stands very close to Giotto, and partly gained in delicacy what he lost in force and originality. Consult: Vasari, *Delle vite dei più eccellenti pittori, scultori ed architetti*, ed. by Milanese, vol. i. (Florence, 1878); Crowe and Cavalcaselle, *History of Painting in Italy*, vol. i. (London, 1864); Thode, *Franz von Assisi* (Berlin, 1855).

GIOTTO, jôt'tô, or AMBROGIO (or Ambrogio, shortened to Giotto) di BONDONE (c.1266-1337). An Italian architect, sculptor, and the creator of Italian painting. He was born near Florence in 1266, the son of a laborer. Two different legends explain his early study of painting: Vasari relates that while a shepherd boy he was seen by Cimabue (q.v.) drawing sheep on a slate; a commentator of Dante says that while apprenticed to a wool merchant he became attracted to Cimabue's studio, and then entered it as this master's pupil (c. 1280). But even the fact of his connection with Cimabue is now strongly contradicted. It has become evident that his style is entirely different from Cimabue's—which was a combination of the Byzantine and Roman schools—and that he was the pupil of the Roman School, developing its early Christian and classic side, and having close relation with his older contemporary Pietro Cavallini (q.v.).

Giotto's earliest works are at Assisi, in the Church of Saint Francis, where several stages in his early progress may be traced, from his intense and revolutionary but juvenile work in the life of Saint Francis, in the upper church, through the series of the "Life of Christ," in the lower church, completed in 1297 or 1298, to the masterly "Allegories of Saint Francis." Returned to Rome in 1298, Giotto painted the altarpiece for Saint Peter's (now in the Sacristy), and designed the "Navicella" in mosaic; the frescoes at San John Lateran and at San Giorgio in Velabro are also attributed to him, but are too much repainted for criticism.

The next stage in his career is marked by the decoration in fresco of the entire Arena Chapel at Padua in 1303, in three rows of compositions illustrating the "Life of Christ," and the "Life of the Virgin," in thirty-eight scenes, besides the "Last Judgment" on the inner façade, the scenes in the choir, and the "Allegories" of the dado. The simplicity, dignity, and dramatic power of these compositions are beyond praise. He reaches here the height of his genius. After executing some almost destroyed works in San Antonio, Giotto returned to Florence and then to Assisi, where he painted the four famous allegorical frescoes in the vault of the lower church—the "Marriage

of Saint Francis with Poverty," the "Triumph of Charity," the "Triumph of Obedience," and the "Glorification of Saint Francis." At some time before 1330 he executed the superb series of frescoes in the chapels at Santa Croce, of which only those in the Bardi and Peruzzi chapels survive in lamentable condition, but sufficiently to show that the religious fervor recently gained had not been lost.

The "Lives of John the Evangelist" and "John the Baptist" (cleaned in 1841 and 1863) in the Peruzzi Chapel are pronounced by many to be the master's greatest work, and the most fruitful inspiration of his successors even during the fifteenth century. The "Ascension of Saint John" also is remarkable, as are the "Dance of Herodias's Daughter" and the "Birth of John the Baptist." The scenes in the Bardi Chapel are from the "Life of Saint Francis," from which even Ghirlandajo and Benedetto da Majano drew inspiration. Giotto went to Naples in 1330, remaining there till 1333 and establishing a fruitful branch of his school. After his return to Florence he was engaged rather in works of architecture and sculpture than painting.

While Giotto's genius undoubtedly expressed itself in freest and most revolutionary fashion in frescoes, his panel pictures are both numerous and important. An early example is the "Virgin and Child with Angels" in the Academy at Florence. There are crucifixes at Santa Maria Novella, at the Ognissanti, and the Arena; important altarpieces at Santa Croce (Florence), in the gallery at Bologna, in the Louvre, and other galleries.

Giotto was also an architect, though probably not of the first rank, except as a designer. He was made chief architect of the Florentine Cathedral in 1334, and his masterpiece of design, the Campanile, called Giotto's Tower, was then begun, and though left unfinished at his death, was carried out according to his plan, even to the smallest details. It is unique among church towers for its wealth of colored patterns and architectural detail and especially of sculptures. It is a square tower, 84 meters high, in three stories. Its reliefs and statues were from his designs, executed partly by Andrea Pisano and other masters, and are among the best works of Italian Gothic sculpture. They are characteristic, allegorical, and philosophic themes of the creation and the moral qualities of man, and the various occupations of human life, artistic, scientific, intellectual, and material. Giotto's share in the building of the cathedral is less clear.

His style was broad and simple, his coloring light and clear, his figures animated and full of expression, in contrast to the previous Byzantine style. At his death his style had penetrated through a large part of Italy, and his followers gave him the compliment of almost slavish imitation. The Giottesque style ruled Italy throughout the fourteenth century as no one man's style ever did before or afterwards. Among his most noted pupils was Taddeo Gaddi (q.v.). For a portrait of Dante by Giotto, see DANTE.

(Berlin, 1885-86); Janitscheck, *Die Kunstlehre Dantes und Giotto's Kunst* (Leipzig, 1892).

GIOVANNI, jō-vān'nē, DOMENICO DI. See BURCHIELLO, DOMENICO.

GIOVANNI, FRANCESCO POGGIO BRACCIOLINI. See POGGIO BRACCIOLINI, GIOVANNI FRANCESCO.

GIOVANNI DA BOLOGNA. See BOLOGNA.

GIOVANNI PISANO. See PISANO.

GIOVINAZZO, jō'vè-nāt'sō. A city on the Adriatic, in the Province of Bari delle Puglie, Italy, 12 miles northwest of the city of Bari (Map: Italy, L 6). It has bastioned walls, a theatre, and a gymnasium. It markets wine, olives, almonds, and building-stone, and manufactures brandy and fish-nets. Population of commune, in 1881, 9665; in 1901, 11,245.

GIOVIO, jō'vè-ō, PAOLO, also known by the Latin form of his name, JOVIUS (1483-1552). A noted Italian humanist and writer. He was born at Como, and studied philosophy and medicine at Padua and at Pavia, but finally turned to literature. His excellent Latin style brought him to the notice of Leo X., who in turn recommended him to the kindness of Cardinal Giulio de' Medici, afterwards Clement VII. Clement showered favors on him, and as a compensation for the loss of all his property, incurred in the sack of Rome, 1527, made him, in 1528, Bishop of Nocera in Naples. Clement's successor, Paul III., looked with disfavor on the worldly, pleasure-loving bishop, and Giovio was compelled to retire to his magnificent villa on Lake Como, where he spent his time in the company of fine pictures and clever men. He frequently visited, however, the various Italian courts, where his genius and *esprit* were greatly admired. He died at Florence, of the gout, and was buried in the Church of San Lorenzo. Giovio was an excellent type of the ecclesiastical pagan of the Italian Renaissance. As an historian he is not to be depended on, being exceedingly incorrect in his facts and shamelessly venal. The following works, however, deserve mention: *Historiarum sui Temporis Libri XLV.* (Florence, 1550-52); *Illustrium Virorum Vitæ* (Florence, 1549-57).

GIPPSLAND, gips'länd. The southeast district of Victoria (q.v.), Australia (Map: Victoria, G 4).

GIPSIES. See GYPSIES.

GIRAFFE, jī-rāf' (formerly also *jaraff*, from Fr. *giraffe*, from Sp., Port. *girafa*, from Ar. *zarāfat*, giraffe, from *zerafa*, to walk slowly), or CAMELOPARD. The tallest of quadrupeds (*Giraffa camelopardalis*), constituting a distinct family of ruminants, Giraffidæ. It is a native of Africa, formerly extensively diffused from Nubia to the Cape of Good Hope, though apparently nowhere abundant. It is now nearly extinct south of

the Zambesi River and east of the Kalahari Desert, and numerous only in the remote interior, where it frequents arid plains. It occurs generally in small herds of from five to forty, and feeds on the leaves and small branches of trees. Its general aspect is remarkable because of the height of the fore parts and great elongation of the neck, the head being sometimes eighteen feet from the ground. The number of vertebrae in the neck is seven, no greater than in other quadrupeds, and the neck has no extraordinary flexibility, but its length is produced by an elongation, elsewhere unknown, of each vertebra. The body is short, and the back slopes from the shoulder to the tail; but the greater height of the fore parts is not owing to the length of the fore legs, which are not really longer than the hind legs, but to processes of the vertebrae which form a basis for the muscular support of the neck and head, and make a hump on the shoulders. The articulation of the skull to the neck is such that the head can easily be thrown back until it is in the same line with the neck, thus giving the animal additional power of reaching its appropriate food. The skull has empty cavities, which give lightness to the head, along with sufficient extent of surface for the insertion of the ligament which supports it. The legs are long and slender; the feet have cloven hoofs, but are destitute of small lateral toes. The head is long; the upper lip entire, projecting far beyond the nostrils, and endowed with considerable muscular power. The tongue is remarkably capable of elongation, and can be thrust far out of the mouth, and employed to grasp and take up very small objects; and by it and the mobile lips, the animal obtains its food, which consists almost wholly of the leaves and twigs of mimosa-trees. The dentition of the giraffe is bovine, but the upper jaw has no canine teeth. The head is furnished with two remarkable protuberances between the ears, generally described as 'horns,' and consisting of a bone united to the skull by an obvious suture, permanent, covered with skin and hair, and terminated by long hard bristles. The nearest analogue is the horn-core of the pronghorn. The ears are moderately long; the tail is long, and terminates in a tuft of long hair that nearly reaches the ground. There is a callosity on the breast. The neck has a very short mane. The hair is short and smooth, reddish white, marked by numerous dark rusty spots.

The eye of the giraffe is very large, lustrous, and commands a wide angle of vision; and the nostrils have a muscle by which they can be closed against blowing sand. It is an inoffensive animal, and generally seeks safety in immediate flight, although it is capable of making a stout resistance, and fights by kicking with its hind legs, discharging a storm of kicks with extraordinary rapidity. It is not easily overtaken even by a fleet horse, and has greatly the advantage of a horse on uneven and broken ground. Its pace is a gallop, the hind legs reaching ahead and astride of the fore feet at every leap. Wise hunters who attempt to pursue giraffes at all on horseback try to push them so hard at first as to get them 'blown,' after which they can drive them steadily toward camp; otherwise the giraffe may gallop for miles. They are exceedingly keen of smell and

GIRAFFE AND OKAPI

1 GIRAFFE (*Giraffa camelopardalis*)

2 OKAPI

hearing, see well, and are game that tax the skill of good sportsmen; yet great numbers have recently been killed for their hides.

The giraffe was known to the ancients, and was exhibited in Roman spectacles. Representations of it appear among Egyptian antiquities. It has been supposed to be the *zemer* of the Jews, translated *chamois* in the English Bible (Deut. xiv. 5). Giraffes are among the rarest and most valuable animals in captivity, although they will thrive well with proper care. In 1892 the last giraffe in the gardens of the London Zoölogical Society died, and for the first time since 1836 the animal was not on exhibition in London; the secretary of the society reported that he saw no immediate prospect of obtaining a living specimen. They have bred in Europe.

A second quite distinct species of giraffe has lately been discovered among those remaining in South Africa, named *Giraffa australis*. The principal characteristics of the new form (consult De Winton, *Proceedings of the Zoölogical Society of London*, 1897, p. 273) are the large size of the median horn, and a generally larger size. Moreover, a brief description has been given by Sir Henry Johnson of a more brilliantly colored giraffe, existing in Uganda, which Beddard (*Mammalia*, 1902), thinks will probably prove to belong to a distinct genus, as it has five horns, the additional pair being placed above the ears. The okapi (q.v.) is also a genus of giraffes.

FOSSIL FORMS. The modern giraffe is the lone relic of the family Giraffidæ that was rather widely distributed during later Tertiary times. The origin of the family is not known, though it seems to have split from the other ungulates at a late date, and to be closely allied to the deers and oxen. Fragmentary skeletons like that of the modern giraffe, perhaps of the same species, are found in the Pliocene deposits of Europe and India. The earliest forms, found in the Pliocene beds of India, Persia, and Southern Europe, have more heavily built skeletons, with shorter necks and larger horns, than does the modern species, and the horns, of which there are often two pairs, are found on the skull of the male only. The principal fossil genera are *Samotherium* and *Sivatherium* (qq.v.).

The best accounts of giraffes are found in the writings of African sportsmen-travelers, such as the books of Sir W. C. Harris, Gordon Cumming, C. J. Andersson, Sir Samuel Baker, H. A. Bryden, and especially of H. C. Selous.

Consult, also, authorities mentioned under ANTELOPE, so far as they relate to Africa; and see PLATE of GIRAFFE AND OKAPI.

GIRALDA, hê-râl'dâ (from Sp. *girar*, to turn). A square tower of the Cathedral of Seville, Spain, built between 1184 and 1196 as a minaret of a mosque. The tower measures 50 feet at its base, and tapers slightly toward the top, 250 feet above. It is richly decorated in Moorish style. From the top of the tower rises a square belfry 100 feet in height, dating from 1568, terminating in a small dome. The latter is surmounted by a statue of Faith, which in spite of its great weight is adjusted to turn freely with the wind, and gives the tower its name. The architecture of the Giralda has been effectively applied to the tower of the Madison Square Garden in New York.

GIRALDÈS, zhê-râl'dàs', JOACHIM ALBIN CARDOZO (1808-75). A French surgeon, born at Oporto, Portugal, and educated in Paris. After acting as surgeon of the Central Bureau of Hospitals at Paris for six years (1848-54), he was compelled to abandon his surgical activity in consequence of an accident. One of the constituent parts of the human testicle bears his name. His contributions to medical science include: *Des luxations de la mâchoire* (1844); *Du traitement des aneurysmes poplités par la compression* (1845); and *Recherches sur les kystes muqueux du sinus maxillaire* (2d ed. 1860). He gave a summary of his long experience as surgeon at the Children's Hospital, Paris, in *Leçons cliniques sur les maladies chirurgicales des enfants* (1869).

GIRALDI, jê-râl'dê, GIOVANNI BATTISTA, sur-named CINTIO (1504-73). An Italian author, born at Ferrara. He studied medicine, philosophy, and belles-lettres, and became Secretary of State under the Dukes Ercole d'Este II. and Alfonso II. of Ferrara. As a member of the Accademia delle Affidati he took the name of Cintio. He is the author of a number of works, particularly *Orbecche* (1541), and several other tragedies, and *Gli hecatommiti* (1565), "A Hundred Tales," translated into French as *Les cents excellents nouvelles* in 1583 by G. Chappuys. The plots of two of Shakespeare's plays, and several of Beaumont and Fletcher's, are traced to his writings.

GIRALDUS DE BARRI (1146?-1220?). An English ecclesiastic and chronicler, best known as Giraldus Cambrensis. He was born in Pembrokeshire of a noble Norman family, and was educated by his uncle, who was Bishop of Saint David's. During his youth he thrice visited Paris, studying and lecturing at the university there. He took holy orders, probably in 1172, and was soon afterwards appointed Archdeacon of Brecknock, in which capacity he showed himself an ardent champion of ecclesiastical privilege and a strict disciplinarian. On the death of his uncle in 1176 Giraldus was chosen Bishop by the chapter of Saint David's, but failed of confirmation by the King, and retired to the University of Paris, where he resumed the study of canon law and theology. He returned to England in 1180, and in 1184 he visited Ireland as preceptor to John, the youngest son of Henry II. In 1188 appeared his *Topographia Hibernica*, a description of Ireland, which still possesses great antiquarian value, though open to criticism in many respects. A tour of Wales which he made in 1188 in the company of Baldwin, Archbishop of Canterbury, resulted in the writing of the *Itinerarium Cambriæ*, which appeared in 1191. About this time Giraldus was offered the bishoprics of Llandaff and Bangor, but refused to accept either, in expectation probably of succeeding to the See of Saint David's, on which his heart was set. In 1198 that office fell vacant and Giraldus was again elected by the chapter, but only to be rejected again by the King, the chief reason for his failure being, perhaps, his Welsh nativity. After a contest lasting five years and repeated appeals to the Pope, Giraldus accepted defeat, resigned his office of archdeacon, and devoted himself henceforth to study. Giraldus's writings, though disfigured by credulity, and marked, in the personal narratives with which they abound,

by excessive vanity, are of great value as materials for the political history and the social condition of the age and the country which they describe. They must be read, however, with caution. His works have been edited in the *Rolls Series* in 8 volumes (1861-91), vols. i-iv. by Brewer, vols. v-vii. by Dimock, vol. viii. by Warner. The *Topographia Hibernica*, *Expugnatio Hibernica*, *Itinerarium Cambriae*, and *Descriptio Cambriae* are published in one volume in Bohn's Antiquarian Library. Consult: Owen, *Gerald the Welshman* (London, 1889); and Gross, *Sources and Literature of English History* (London, 1900).

GIRANDOLA, jê-rân'dô-lâ. A splendid display of fireworks formerly given at the Castle of Sant' Angelo, Rome, on the coronation of a new Pope and at the feast of Saint Peter, June 29th. It was later transferred to the Pincian Hill, and given on the first Sunday in June.

GIRANDOLE, jê-rân'dô-lâ, BERNARDO DELLA. See BUONTALENTI, BERNARDO.

GIRARD, jî-rârd'. A city and the county-seat of Crawford County, Kan., 26 miles south by west of Fort Scott; on the Atchison, Topeka and Sante Fé and the Saint Louis and San Francisco railroads (Map: Kansas, H 4). It is the centre of a fertile agricultural and stock-raising section, near extensive bituminous coal fields, and has zinc-smelters, a foundry, and stove-works, flour-mills, brick-yards, and other industrial establishments. The water-works are owned by the municipality. Population, in 1890, 2541; in 1900, 2473.

GIRARD, CHARLES (1822-95). An American naturalist, born at Mülhausen, Alsace. He was a pupil and assistant of Louis Agassiz at Neuchâtel, and later was associated with Agassiz in scientific investigations in the United States from 1847 to 1850. In 1850-59 he was connected with the Smithsonian Institution. With Prof. S. F. Baird (q.v.), of the Institution, he made extensive studies of reptiles and wrote the article "Reptiles" in Stansbury's *Exploration and Survey of the Great Salt Lake of Utah* (1853), and a *Catalogue of North American Reptiles in the Museum of the Smithsonian Institution: Part I., Serpents* (1853). Among his independent writings are *Herpetology of the United States Exploring Expedition Under the Command of Captain Wilkes* (1858), and a "Report upon Fishes" for Emory's *Survey of the United States and Mexican Boundary* (1859).

GIRARD, zhê-râr', FIRMIN (1838-). A French genre painter, born at Poncin (Ain). He studied under Gleyre in Paris. His works are painted anecdotes, such as "The Fiancées," "The First Communion," "After the Ball," "The Betrothal," and "A Wedding in the Last Century." They are executed in brilliant colors and are minutely finished. Many of his pictures are owned in this country.

GIRARD, JEAN BAPTISTE, 'Le Père Girard' (1765-1850). A Swiss pedagogue, born at Fribourg. He became a novice in the Franciscan Order and was ordained at Würzburg, where he taught for several years. Then he returned to Fribourg (1804) as director of the primary schools, and remained there until 1823. His success in his chosen work was remarkable, but his ideas were considered too liberal, and the Jesuits

were more powerful than the Franciscans, so 'Le Père Girard' was compelled to give up his school. Until 1834 he taught philosophy at Lucerne; then he came back to Fribourg and lived in what one of his biographers calls 'a laborious retirement.' Here he wrote his *Cours éducatif de la langue maternelle* (1844-46), which was awarded a prize by the French Institute. Villemain, who gives him the highest praise, sums up his theory of teaching in these words: "The only, the really popular school is one in which all the elements of study serve in the cultivation of the mind, and where the child is led himself by the things he learns, and by the way in which he learns them." Girard was himself a grammarian of the first order, but he said, instead of 'a grammar of words,' let us have 'a grammar of ideas.' His influence has grown and still grows in Switzerland, France, and Italy, and is felt in much of the improvement recently made in the teaching of the elementary French schools. A critical judgment places him next to Pestalozzi among Swiss pedagogues.

GIRARD, JULES (1825-). A French scholar, born in Paris. He was successively professor of rhetoric at the College of Vendôme, and at the Lyceum of Lille, and ultimately became professor of Greek poetry at the Faculty of Letters of Paris (1874). He wrote: *Mémoire sur l'île d'Eubée* (1852); *Essai sur Thucydide* (1860-84); *Hypéride, sa vie et son éloquence* (1861); *Un procès de corruption chez les Athéniens* (1862); *Etudes sur l'éloquence attique* (1874-83); *Etudes sur la poésie grecque* (1884); and numerous articles in the magazines and journals.

GIRARD, MARC AMABLE (1822-92). A Canadian politician, born at Varennes, P. Q., and chiefly active in Manitoba affairs after the admission of that province into the Dominion of Canada in 1870. He was Provincial Treasurer in 1870-72, Premier in 1874, and between 1879 and 1883 held the offices of Provincial Secretary, Minister of Agriculture, and president of the Council. After the admission of Manitoba he was appointed a Dominion Senator. He was a Conservative in politics.

GIRARD, NOËL JULES (1816-). A French sculptor, born in Paris. He was a pupil of David at the Ecole des Beaux-Arts, and first exhibited at the Salon in 1849. His "Vintager Pressing the Grape" (1852) was bought by the Government, and his "Comedy" and "Drama" were accepted as the pediment for the side-façade of the Paris Opéra. Others of his works are 'La Rochefoucauld' and 'L'Astronomie,' both in the Louvre.

GIRARD, PAUL ALBERT (1830-). A French landscape and genre painter, born in Paris. He studied with his father and at the Ecole des Beaux-Arts, and subsequently worked for a time in the studios of Flandrin and Bellel. In 1861 he won the Grand Prix de Rome. His works, which consist chiefly of scenes from French and Algerian life, include the following: "Negro Dance at Algiers" (1875); "Moorish Interior" (1875); "Arab Hunters in Mountains of Blidah" (1883); "Strand at Villerville" (1883); "Oat Field in Picardy" (1884); "Charity Office of the Twentieth Arrondissement" (1885).

GIRARD, PHILIPPE HENRI DE (1775-1845). A French mechanician and inventor. He was born

at Lourmarin, Vaucluse, and manifested a strong aptitude for mechanical invention, also showing a fondness for botany, painting, and literature. At the age of eighteen he established a soap manufactory at Leghorn, where his family had removed on account of the Revolution, and where he supported himself for some time by painting. Returning to France after the fall of Robespierre, he became professor of chemistry and of natural history at Nice. About 1800 he went to Paris, and there established a soap manufactory. Girard invented and patented a successful flax-spinning machine, for which a reward of one million francs had been offered by Napoleon. In 1813 he established a flax-mill at Paris and another at Charonne, in both of which he made use of his machine; but although he was declared to have earned the reward offered, the fall of Napoleon in 1815 left the decree unfulfilled. Girard now on this account becoming involved in serious money difficulties, he engaged in manufacturing flax and steam navigation on the Danube until 1825. In that year he became attached to the Russian Government to promote the manufacture of flax, and later was appointed chief engineer of the mines of Poland. In 1844 he returned to France, and exhibited at an industrial exposition a large number of his inventions.

GIRARD, PIERRE SIMON (1765-1836). A French civil engineer, born at Caen. At the age of twenty-four he was engaged as engineer in the construction of roads and bridges, and upon his return from the Egyptian campaign in 1802 was appointed chief of that department. He built the canal from the Ourcq River to Paris (1802-20), and in 1819 was director of the Department of Gaslight Illumination in that city, in which capacity his researches on the then comparatively new illuminating agent were highly important. His principal writings include: *Traité analytique de la résistance des solides* (1798); *Rapport des ponts et chaussées sur le projet général du canal de l'Ourcq* (1803); *Mémoire sur le canal de l'Ourcq et la distribution de ses eaux* (1831).

GIRARD, STEPHEN (1750-1831). An American merchant and philanthropist. He was born at Bordeaux, France, the son of a sea captain; became a sailor in 1764, and at the age of twenty-three was captain and part owner of a ship engaged in the West Indian and American coasting trade. In 1776 he settled in Philadelphia, but continued in the coasting trade until stopped by the outbreak of the Revolutionary War. Espousing the cause of the Colonies, he remained in America, dealt in a small way in army supplies, and in 1780 again embarked in the West Indian trade, this time on a more extensive scale, and in a few years, by a succession of lucky ventures, had accumulated a considerable fortune. In 1810 he became largely interested in the first United States Bank, and in 1812, upon the lapsing of its charter, he purchased the greater part of its stock, and its building. He retained the old officers, only renaming it "The Bank of Stephen Girard," succeeded to much of the old bank's business, and made it one of the soundest and most successful financial institutions in America. During the War of 1812 he was the chief financial support of the Government, advancing it large sums to enable it to continue military operations, and in 1814 took up practically an entire loan of \$5,000,000, after

subscribers had been sought in vain. On the re-chartering of the second United States Bank in 1816, he became one of its principal stockholders and a director, and exercised a dominant control over its policy for many years. Upon his death he left almost his entire fortune of \$7,500,000 in public benefactions, chief of which was Girard College (q.v.), in the regulations for the control and management of which he incorporated his ideas as to freedom of thought and religious belief. Girard's personality was forbidding, and his personal appearance most unattractive. Penurious and almost miserly in small affairs, a close and shrewd business man, and a hard task-master, he was, nevertheless, generous and open-handed in his benefactions even during his life, and self-sacrificing and public-spirited to a degree, as his personal services to the people of Philadelphia, when that city was ravaged by a yellow-fever epidemic in 1793, showed. Consult: Ingram, *Life and Character of Stephen Girard* (Philadelphia, 1884); and a sketch in *Semicentennial of Girard College* (ib., 1898).

GIRARD COLLEGE. An institution for the education of orphans, founded in 1832 at Philadelphia, Pa., under the will of Stephen Girard (q.v.). Mr. Girard died in 1831, bequeathing the residue of his estate, valued at \$5,260,000, in trust to the Mayor, aldermen, and citizens of Philadelphia for the establishment of an institution for the education and maintenance of 'poor white male orphans.' The age of admission was fixed by Mr. Girard at between six and ten, and the age of leaving at between fourteen and eighteen, at which time students were to be bound out in the arts and trades. Applicants for admission were to be preferred, first as coming from Philadelphia, second from Pennsylvania, third from New York, and fourth from New Orleans. The courses of study were to be in the main practical; insistence being laid upon 'facts and things rather than words or signs.' The principles of 'pure morality' were to be taught, but the inculcation of religious doctrine in a denominational sense was forbidden, and—most famous clause of a famous will—ministers and ecclesiastics of every sect were prohibited from holding office in the college or from entering its premises upon any pretext whatsoever. Preliminary action looking to the due execution of Mr. Girard's will was taken by the Philadelphia City Councils in 1832, a board of trustees was elected in 1833, and in the same year the corner-stone of the main building was laid. This building erected in the form of a Greek temple, was completed in 1847, at a cost of nearly \$2,000,000. In the meantime suit had been brought by Mr. Girard's heirs to have his will set aside, and the case was not decided until 1844, when the United States Supreme Court, notwithstanding the pleading of Daniel Webster for the plaintiffs, held the will to be valid. In 1848 the college was formally organized with 100 pupils and 17 instructors and officers, the income at that time being about \$118,000 annually.

The management of the institution was then vested in a board of trustees elected by the City Councils. But the frequent political changes in the Councils and the consequent changes made in the board of directors produced results so unsatisfactory that by legislative act of 1869 the appointment of the directors was given to the

judiciary. Under the new board the funds of the college increased 100 per cent. and the income 200 per cent.; eight buildings were added to the six existing, and the number of pupils increased from 550 in 1875 to over 1500 in 1900. Coincidentally, the courses of study, at first elementary, were greatly extended to meet new academic and industrial conditions. They now comprise on the one hand preparation for the leading American colleges, and on the other thorough training in the leading industrial arts. Military drill under the supervision of an army officer, manual training, and summer encampments have also been introduced. The institution has met with marked success in placing the majority of its pupils in permanent and often valuable commercial positions. The total value of the property under the control of the institution is about \$16,000,000, and the annual income is \$1,000,000.

GIRARDET, zhé'rär'dä'. A family of Swiss artists. **ABRAHAM** (1764-1823) was born at Locle, and was a pupil of B. A. Nicolet. He engraved plates after Raphael, Del Sarto, and Giulio Romano, and was noted as a vignettist.—**CHARLES SAMUEL** (1780-1863), his brother, also born at Locle, was the first to engrave in relief on stone.—**KARL** (1810-71), his son, was born at Locle, and was the pupil of Léon Cogniet. He painted a number of successful historical pictures, some of which are in Versailles.—**EDOUARD HENRI** (1819-80), Karl's brother, was born at Neuchâtel. He was a genre painter and engraver.—**PAUL** (1821-93), another brother of Karl, was born at Neuchâtel. His first appearance at the Salon was made in 1842 with copper-plate engravings from four 'landscapes' by his brother Karl. Among the more noteworthy of his works are: "The Battle of Isly" (after Horace Vernet); "Washington Crossing the Delaware" (after Leutze); "The Combat of Rivoli" (after Philip-poteaux); and "The Armada in Sight of Plymouth" (after Seymour Lucas).

GIRARDIN, zhé'rär'dän', **EMILE DE** (1806-81). A French legislator and publicist. He was born in Switzerland, an illegitimate son of Alexander, Count Girardin. Until his twenty-first year he bore the name of Delamothe. After engaging in various journalistic enterprises, he was elected in 1834 a member of the Chamber of Deputies, in which he served for many years. As the founder and editor of the conservative and Royalist organ *La Presse*, he secured the patronage of the Court, and though compelled temporarily to resign the editorship during his term in the Legislative Chamber, he again conducted the paper from 1851 to 1856 and in 1866, when he sold it to the banking house of Millaud & Co. In 1867 he acquired for 500,000 francs the journal *La Liberté*, in which he served the interests of the Empire, and which he converted into a violent anti-Prussian paper. This was followed in 1871 by *L'Union Française*. After conducting various other papers, such as the *Journal Officiel* and *La France*, he retired in 1881, with a capital estimated at one million francs, after a long and conspicuous career as a journalist and legislator. In the former capacity he was probably, in some respects, the chief leader of his day. The history of his origin and early childhood is recounted in the first novel published by him, and entitled *Emile* (1827). His other writings include: *La fille du millionnaire*, a comedy in three

acts (1858); *Etudes politiques* (2d ed. 1849); *De l'instruction publique en France* (2d ed. 1842); *La politique universelle, decrets de l'avenir* (4th ed. 1854); *L'homme et la femme* (1872); *Le supplice d'une femme*, a comedy (1865), frequently republished and highly successful.

GIRARDIN, JEAN PIERRE LOUIS (1803-84). A French chemist, born in Paris. He became professor of chemistry at Rouen in 1828 and at Lille in 1858, and was appointed rector of the academy at Clermont-Ferrand in 1868. He devoted himself especially to the applications of chemistry to art, industry, and agriculture, and published: *Considérations générales sur les volcans* (1830); *Du sol arable* (1842); *Des fumiers et autres engrais animaux* (1875); *Traité élémentaire d'agriculture* (1874); and *Chimie générale et appliquée* (1868-69).

GIRARDIN, MADAME DE. See GAY, DELPHINE.

GIRARDIN, SAINT-MARC. See SAINT-MARC GIRARDIN, FRANÇOIS AUGUSTE.

GIRARDON, zhé'rär'dôn', FRANÇOIS (1630-1715). A leading French sculptor of the Court of Louis XIV. He was born at Troyes, March 17, 1630, the son of a bronze-founder, Nicolas Girardon. As a boy he entered the service of one Baudesson, a wood-carver and furniture-maker, whose son was a painter of some importance. Although intending to become a sculptor, Girardon learned to paint, and at the age of fifteen decorated a chapel of Sainte Julie in Troyes. There is some good work of the Renaissance in Troyes, which was a source of inspiration to the sculptor. His first work in sculpture was a statue of the Virgin in his native city. At this time the Chancellor Séguier undertook certain improvements at his Château of Saint-Liébaud. Baudesson, who was employed on the work, took with him the young Girardon. Séguier became interested in the boy, and, as he had been with Le Brun, sent him to Paris and afterwards to Rome. In Rome, through the influence of the painter Pierre Mignard, also of Troyes, he came under the direct influence of Lorenzo Bernini, the greatest sculptor of that day. When Girardon removed to Paris in 1653 he came into relations with Le Brun, and worked under his powerful direction for many years. He entered the Academy of Painting and Sculpture, January 7, 1657, and in the same year married Catherine du Chemin, a painter of considerable skill, who was herself admitted to the Academy in 1663. In 1668 Girardon visited Rome a second time, returning to Paris in 1669. The rôle which he now played was a large one. He was lodged in the Louvre, was professor at the Academy (since 1659) and enjoyed the full favor of the Court. In 1695 he became chancellor of the Academy. The most notable works of Girardon were the monument of Richelieu in the Church of the Sorbonne, Paris, which Alexandre Néroir saved at the risk of his life in the Revolution, and the equestrian statue of Louis XIV., which once stood in the Place Vendôme. The group of the "Rape of Proserpine" at Versailles may also be mentioned. There are many busts, bas-reliefs, and small works in the Louvre (Paris). Of his decorative work, done under the influence of Le Brun, there is a little in the Gallery of Apollo in the Louvre. The greater part of it, however, is grouped about the

palace and park of Versailles. It is all interesting, and some of it, like the nymphs in the bas-reliefs of the "Baths of Diana," lovely and delicate.

Consult: Corrad de Breban, *Notice sur la vie et les œuvres de Girardon* (Paris, 1850); Genevay, *Le style Louis XIV.* (ib., 1886); Gonse, *La sculpture française* (ib., 1895); Lambert, *Versailles et les deux Trianons* (ib., 1900).

GIRART DE ROSSILHO, zhé'rär' de rôs-sé'lyô. An epic poem composed in a northern Provençal dialect, and forming part of the Carolingian cycle. Consult Saintsbury, *French Literature* (Oxford, 1882).

GIRASOL, jîr'a-sôl (Fr., Sp., Port. *girasol*, from It. *girasole*, from *girare*, to turn, from Lat. *gyrus*, circle). A name given to precious stones that show reflections of bright red or yellow light, which apparently come from the interior of the mineral. The name is especially applied to the *fire opal*, which is of a milky bluish color, translucent, and shows reddish reflections in a bright light. The best-known specimens are found at Zimapan, Mexico, and in the Faroe Islands. (See **OPAL**.) The name has also been given to the *asteriated sapphire*, or star sapphire, fine specimens of which have been found in India. *Girasols* were highly esteemed by the ancients, and when of good quality commanded high prices. They are now made artificially, and are no longer so highly prized as formerly.

GIRAUD, zhé'rô', EUGÈNE (1806-81). A French genre painter and engraver, born in Paris. He was a pupil of Richomme in engraving and of Hersent in painting; won the Grand Prix de Rome in 1826, returned to Paris in 1832, and, with the Duke of Montpensier and Alexandre Dumas, visited Spain and North Africa in 1846. Among his best-known pictures are: "Rescue of the Dauphin Charles by Stephen Marcel in 1358" (1836); "The Army of Condé and Coligny Crossing the Loire" (1837); "Dance in a Posada at Granada" (1853); "Dancing Girl in Cairo" (1866), and "The Dying Matador" (1869), both in the Luxembourg; "Jeweler in the Harem" (1874); "Flower Market Under the Directory" (1876); "Return from the Tavern" (1877). His brother and pupil, CHARLES (1819-92), painted genre scenes and interiors, such as "Spinning Women in Brittany" (1873), and "Flemish Interior" (1876).

GIRAUD, GIOVANNI, Count (1776-1834). An Italian dramatist, born in Rome. His first success was in *L'onesta non si vince* (1798). This was followed by a number of plays, among them: *L'ajo nell'imbarazzo* (1824); *Il prognosticante fanatico*; *La capricciosa confusa*; *La conversazione al bujo*; and *Don Desiderio*. His plays, collected under the title *Teatro*, were published in 1823. He was made director-general of all the theatres in Italy by Napoleon in 1809.

GIRBADEN, gër'bä-den, CASTLE OF. An extensive ruined fortress near Grendelbruch, in Lower Alsace, the inner fortress of which belongs to the tenth century, and the outer castle to the early thirteenth. Originally possessing fourteen gates and fourteen courts, it still retains evidences of the elaborateness of its design in its great square donjon, and in its hall with beautiful windows bordered with columns arranged in clusters.

GIRDER. A beam which is intended to be supported at either end, and to carry a vertical load between the ends. Girders are simple when they are supported only at the two ends; continuous when they extend over one or more intermediate supports as well; solid when, like a rolled I-beam, the upper and lower flanges are connected by a solid web; and braced when the upper and lower flanges are connected by an open framework of diagonal or combined diagonal and vertical members. (For description of plate girders and braced girders, see **BRIDGE**.) A box girder is a solid girder in which the flanges are connected by two web plates in such a manner that a cross-section of the girder is box-shaped or rectangular in form. (See **ROLLING-MILL** for a description of steel shapes.) Girders may be of timber, but they are more commonly of steel, which has almost entirely replaced cast iron and wrought iron.

GIRDLE (AS. *gyrdel*, OHG. *gurtel*, Ger. *Gürtel*, from AS. *gyrdan*, OHG. *gürten*, Ger. *gürten*, to gird; connected with AS. *gearde*, Goth. *gards*, OHG. *gart*, Ger. *Garten*, garden, and ultimately with Lat. *hortus*, Gk. *χῆρος*, *chortos*, garden, OIr. *gort*, corn-field). A band or cord worn round the body to confine or support other garments. It was minutely prescribed to the children of Israel to be worn by the priests, made "of gold, of blue, and purple, and scarlet, and fine twined linen" (Ex. xxviii. 8, xxix. 40); but it was worn by others as well: all through the Bible 'to gird up the loins' is a common symbol of activity and alertness. The *zona* (Gk. *ζώνη*), of classical antiquity was a broad band worn by young women before marriage; hence the expression *zonam virginem solvere* is a periphrasis for marriage. Men also, among the Greeks and Romans, wore a broad band or belt which often served for carrying money and other small articles. The *cingulum* or common girdle, sometimes called *cestus*, Gk. *στροβίλιον*, was worn higher, under the breasts, as in the modern Empire costume. The name *cingulum* was also applied to the sword-belt, which formed a regular part of the Roman soldier's uniform. All through the Middle Ages girdles of various shapes were part of the costume, both of men and women, used at first to confine the loose and flowing garments of the period, and frequently decorated with such great richness that numerous sumptuary laws were passed in England and elsewhere to restrain it; but by the sixteenth century the need of confinement had passed away from the more closely fitting garments of the time, and the importance of the girdle declined. For its use as a Church vestment, see **COSTUME**, ECCLESIASTICAL.

GIRDLE OF VENUS. A remarkable ctenophoran jellyfish (translation of Latin *cestum veneris*), inhabiting the Mediterranean, of a ribbon-like shape, some five or six feet in apparent length by about two inches in breadth; although, considered with reference to the structure of the animal, the apparent length is really its breadth, and the apparent breadth its length. The mouth is situated in the middle of the inferior edge, and the stomach is imbedded in the gelatinous substance. The edges are bordered by rows of swimming plates, by the movements of which the creature seems to be propelled in the water. It exhibits lovely iridescent colors by day, and bril-

liant phosphorescence by night. Its substance is so delicate that it is difficult to obtain a perfect specimen.

GIRDLER. A small cerambycid beetle (*Onchideres cingulatus*), which girdles the twigs of hickory, pear, and other trees. It is grayish brown, with a light-colored band across the elytra. In August this beetle lays its eggs near the tips of twigs, then gnaws a deep furrow around the twig behind them. The winds of autumn break off the end of the girdled twig, which falls to the ground. Then the eggs hatch, the grubs feed upon the decaying wood, leaving only a shell of bark, and attain their full growth during the summer. They then pupate, and produce imagoes a year from the time the eggs were laid. Extensive damage sometimes results from the great numbers of these twig-girdlers.

GIRGEH, gër'ge (from Coptic *Girgis*, George, in honor of the patron saint of the town). The capital of the Egyptian province of the same name, and former capital of Upper Egypt, situated on the left bank of the Nile, and about 90 miles southeast of Assiut by rail (Map: Egypt, E 6). It has a number of mosques, and a Government cotton-factory. In the vicinity is an old Roman Catholic monastery. Population, over 17,000.

GIRGENTI, jër-jân'tè (ancient Agrigentum, q.v.). The capital of the Province of Girgenti, Sicily, 84 miles by rail southeast of Palermo, 1083 feet above the sea (Map: Italy, H 10). It is three miles from the Mediterranean and six miles by rail from Porto Empedocle (q.v.). The weather is usually clear and mild. The town is the seat of a bishop, of an American consular agent, and is a station for a regiment of infantry. The fourteenth-century cathedral, with unfinished campanile, has been completely modernized. It contains a Madonna by Guido Reni, and a famous ancient marble sarcophagus with relief, illustrating the story of Hippolytus (q.v.). In the cathedral archives are many documents of the Norman period. The city museum has a fine marble statue of Apollo, vases, coins, etc. Girgenti commands a beautiful view of the sea, and at sunset in clear weather Pantelleria, 90 miles to the southwest, can be seen. It has a chamber of commerce, an important public library, founded in 1765 by Bishop Lucchesi, a technical school, a royal-technical institute, a royal gymnasium, a royal female normal school, a seminary, and a municipal theatre. The most important commercial product is sulphur, of which about 3,000,000 quintals (metric) are exported annually. There are also important salt-mines. Other products are wine, oil, almonds, grain, cheese, honey, earthenware, salt fish. Population of the commune, in 1881, 21,274; in 1901, 25,024. Consult Picone, *Memorie storiche agrigentine* (Girgenti, 1865).

GIRLS' CLUBS. See WORKING-WOMEN'S CLUBS.

GIRNAR, gîr-nâr'. A sacred mountain of remarkable aspect, in the peninsula of Kathiawar, part of the native State of Gujarat, Bombay, India, in latitude 21° 30' N. and longitude 70° 42' E., 230 miles northwest of Bombay. Above luxuriant hills and valleys surrounding its base rises a bare and black rock of granite to the height of about 3500 feet above the sea. The summit is broken into various peaks, its northern and southern sides being nearly perpendicular. An

immense boulder, which seems to be poised on one of the scarped pinnacles, is called the Beiru Jhap, or Leap of Death, from its being used by devotees for the purpose of self-destruction. On a ledge about 600 feet below the summit there is a group of sixteen ancient Jain temples.

GIRNDT, gërnt, Otto (1835—). A German dramatist. He was born at Landsberg-an-der-Warthe, and was educated at Berlin and Heidelberg. He wrote many plays, two of which were awarded prizes at Vienna and Munich. They include the comedies *Y I* (1865); *Und; Am andern Tage*; *Orientalische Wirren* (1877); *Die Sternschnuppe* (1886), a farce, with Moser; *Nervös*, a farce, with Moser (1889); *Endlich* (1891); and *Dreizehn* (1892). His tragedy *Danckelmann* (1883) was also very favorably received. His novels are less popular.

GIRODET-TRIOSON, zhë'rô'dâ' trë-ô'zôn', ANNE LOUIS (1767-1824). A French historical painter. His real name was Girodet de Roussy, and he was born at Montargis. He was adopted and educated by M. Trioison, the Court physician, whose name he assumed in later years. He was a pupil of David, and in 1789 he took the Prix de Rome. In pursuing his studies at Rome he cultivated a sentiment in his work which had not developed in the studio of David, where correct and classical drawing was considered paramount. His "Sleep of Endymion," now in the Louvre, was painted at this time; it is said the figure was copied from a bas-relief. In 1792 Girodet painted "Hippocrates Refusing Presents Sent from the King of Persia," a gift to Dr. Trioison, who bequeathed it to the Medical School of Paris. In 1802, at the request of Napoleon, he executed "Ossian and His Warriors Receiving the Shades of French Warriors," and in 1806 he exhibited his "Scene of the Deluge," which received a prize over David's famous "Sabines," but it has been severely criticised as poor in composition. "Pygmalion and Galatea," his last and one of the best works, was exhibited in 1819. His large historical pictures, the "Surrender of Vienna to Napoleon" (1808), and the "Insurrection at Cairo" (1810), both at Versailles, are less pleasing, and his portraits are cold and dry. In the "Burial of Attila" Girodet was more successful. His efforts to combine the teachings of the classic with his own romantic spirit sometimes produced grotesque results, but Girodet helped to make possible the later school of the Romanticists. He was very wealthy; he was made member of the Institute in 1815, and chevalier of the Legion of Honor in 1816. He died in Paris, and, by order of Louis XVIII., was decorated with the cross of officer of the Legion of Honor when in his coffin. Consult his *Œuvres posthumes* (Paris, 1830).

GIROFLÉ GIROFLA, zhë'rô'flâ' zhë'rô'flâ'. An opera-bouffe in three acts by Lecocq, with words by Leterrier and Vanloo, based on the adventures of twin sisters, daughters of a Spanish nobleman. It was first produced at Brussels in 1874.

GIRÓN, Hé-rôn', Don PEDRO TELLEZ Y. See OSUNA.

GIRÓN, FRANCISCO HERNANDEZ (1510-54). A Spanish soldier, born at Cáceres, Estremadura. He went to Mexico at the age of twenty-five, whence he proceeded to South America, where he engaged in the wars in New Granada, and as-

sisted in the conquest of the country. After the defeat of Pizarro (1548) he organized a revolt against Gasca at Cuzco, and defeated the royal forces under Alvarado. He was subsequently captured, condemned to death at Lima, and executed there.

GIRONDE, zhé'rônd'. A maritime department in the southwest of France, formed of part of ancient Guienne, bounded on the west by the Bay of Biscay, on the north by Charente-Inférieure, on the east by Dordogne and Lot-et-Garonne, and on the south by Landes (Map: France, F 7). Area, 3761 square miles. The surface is generally level, but hilly in the east. It is watered by the Garonne, which expands into the estuary called the Gironde, and by its affluent the Dordogne. Gironde is one of the principal wine-producing departments of France. The other products are grain, vegetables, fruit, and hemp. Population, in 1891, 793,528; in 1901, 821,131. Capital, Bordeaux.

GIRONDISTS (Fr. *Girondins*, from *Gironde*, a department of France). The party of moderate Republicans during the French Revolution. When the Legislative Assembly met in October, 1791, the most remarkable group of men in it were the Deputies, most of them new men, from the Department of the Gironde. Barennes, Ducos, Servière, Vergniaud, Guadet, Gensonné, Sers, and Grangeneuve were the chiefs of their group. They soon showed themselves to be orators of ability, and their moderate republicanism drew to their side such men as Brissot, Roland, Condorcet, Pétion (later Mayor of Paris), Dumouriez, and Lacoste. They assumed the name Girondins, controlled the *Patriote Français*, and their influence dominated the Jacobin Club. For more than a year they directed the affairs of government. They had a majority in the Assembly, and the King was forced to select Roland, Dumouriez, Clavière, and Servan as ministers in March, 1792. The forced resignation of the Girondist Ministry, some three months later, led to the popular insurrection of June 20th. Though there were elements of dissension between the Girondists and the Jacobins as early as the spring of 1792, both parties united in bringing about the overthrow of the monarchy through the insurrection of August 10, 1792. The responsibility for the September massacres is harder to determine, but probably the leaders of the Girondists were not implicated in the atrocities of the mob. After that date they lost more and more of their popularity, for though their eloquence still dominated in the Assembly, they were unable to control the Parisian rabble. The result was that the Jacobins obtained the upper hand, and ousted the Girondists from office under the National Convention. Danton and his followers triumphed over Roland and his; Dumouriez deserted the side of the Revolution, and not a single Girondist figured on the newly formed Committee of Public Safety. The failure of the Girondists to arrest and impeach Marat was followed by the invasion of the hall of the Convention by a Jacobin mob on May 31, 1793, and the arrest on June 2d. of about twenty of the leaders of the party. Many others fled to the provinces or escaped from France. Unsuccessful risings took place throughout France in their behalf, the only result being that further arrests were made. On October 3, 1793, the prisoners

were accused before the Convention of conspiracy against the Republic, and were sent to be tried by the Revolutionary Tribunal. On October 24th, therefore, they were arraigned before this body. They were at first allowed to defend themselves; but their speeches were so eloquent and their innocence so apparent that the court could not condemn them, and the Convention was forced to order that the investigation be closed, and that the prisoners be executed, October 31, 1793. This bloodthirsty decree was carried out the same evening. Brissot, the leader of the party (from whom they were sometimes known as Brissotins), Vergniaud, Gensonné, Ducos, and sixteen others were sent to the Place de Grève. On the way thither they chanted the Marseillaise, and met their death with splendid courage. Others of the Girondists were subsequently brought to the guillotine, including Madame Roland, whose charms, intellect, and ardor had made her an inspiring influence in the party. In the provinces also there were executions. Roland, Vilazé, Rebecqui, Pétion, Buzot, and Condorcet preferred suicide to the guillotine, and by the close of 1794 the Girondist Party had all but disappeared. Those of the party who survived, including Lanjuinais, Defermon, Pontécoulant, Louvet, Isnard, and La Rivière, reappeared in the Convention after the fall of Robespierre and the Terrorists, but they no longer formed a party of importance. Lamartine has written a panegyric on the Girondist Party, *Histoire des Girondins* (Paris, 1847), translated by Ryde, and published in London in the same year. For more impartial and accurate accounts, consult: Guadet, *Les Girondins* (new ed., Paris, 1889); Bire, *La légende des Girondins* (Paris, 1881); Vatel, *Charlotte de Corday et les Girondins* (Paris, 1864-72). In English, the following are worth consulting: Mignet, *The French Revolution* (London, 1826); Morse-Stephens, *History of the French Revolution* (New York, 1886-91). See FRENCH REVOLUTION, also the special articles on the various Girondist leaders, with the authorities referred to there.

GIRON LE COURTOIS, zhé'rôn' le kōōr'twā' (Fr., Giron the courteous). The hero of a thirteenth-century romance of the same name, by Rusticien, derived from an earlier romance, *Palamedes*, by Elie de Borron. The printed edition rests upon Rusticien's version.

GIROUARD, zhé'rōō'ār', Désiré (1836—). A Canadian judge of the Supreme Court. He was born at Saint Timothée, Province of Quebec, and was educated at McGill University. A work published by him under the title *Essai sur les lettres de change et billets promissoires* made him widely known, and insured his rapid advancement in the profession. He was elected the representative of Jacques Cartier in the Canadian Parliament (1878), and continued to represent that county until 1896, also acting for many years as chairman of the Standing Committee on Privileges and Elections. He strongly opposed the execution of Louis Riel, and introduced and carried several bills, the most important of which was the so-called 'Deceased Wife's Sister Bill' (1882). His literary productions include two volumes of interesting essays upon legal subjects, and the *Early History of Montreal*, translated from the French by his son.

GIROUETTES, zhé'róo'et', LES (Fr., the weather-vanes). A term of reproach applied in the *Dictionnaire des Girouettes* (Paris, 1815) to those who changed their political party on the return of the Bourbons after Napoleon's fall. The number of changes in political faith was indicated by a corresponding number of weather-cocks printed after the names.

GIRTIN, gēr'tin, THOMAS (1775-1802). An English water-color painter, born in Southwark, in 1775. He was a pupil of Edward Dayes, and a friend of Turner. Girtin was one of the founders of the English water-color school. He was a contributor to the exhibitions of the Royal Academy from 1794 to 1801, his subjects including views of London, of Paris, and scenes in Scotland and Wales, where he made extensive sketching tours; he also painted several English cathedrals. He advanced the art of water-color painting in technique, color, and poetic interpretation. He died in London. The British Museum possesses a fine collection of his drawings. Other works are found in the South Kensington Museum, the National Gallery of Scotland, and the National Gallery of Ireland. Consult Miller, *Turner and Girtin's Picturesque Views* (London, 1854).

GIRTON (gēr'ton) COLLEGE. One of the most noted institutions for the higher education of women in England. It was established in 1869, in a rented house at Hitchin, Hertfordshire, with six students. It was conducted in the main under the influence of members of Cambridge University, from among whom its lecturers were recruited. The inconvenience of its distance from that university led to its removal, in 1873, to its present location, about two miles from Cambridge. Since then it has increased greatly in numbers and influence. Its students follow essentially the same course of work as the Cambridge undergraduate who studies for honors. Since 1881 its members have been admitted to the university examinations, and their names appear in the tripos, or honor lists, in the university calendar. They do not, however, receive degrees from the university, but are granted degree certificates upon satisfying the university requirements. There are now over 100 students. The buildings are very handsome, forming three sides of a quadrangle, and are in attractive grounds. The administration is vested in an executive committee, a mistress, and a vice-mistress, and the instruction is carried on, as in a college of the university, by lecturers and tutors. See CAMBRIDGE, UNIVERSITY OF; COLLEGIATE EDUCATION FOR WOMEN.

GIRTY, gēr'ti, SIMON (1741-1818). A notorious renegade leader of the Indians. He was born in what is now Dauphin County, Pa.; was captured by the Indians, along with the rest of his family, at Fort Granville, in 1756; was released in 1759, and acted as an interpreter for some time after the conspiracy of Pontiac. In Lord Dunmore's War he served against the Indians, and for a short time thereafter was a second lieutenant in the Virginia militia. In 1776 he was appointed an Indian interpreter for the United States, but was soon discharged, after which he enlisted troops in the vicinity of Fort Pitt for service against the English. He went over to the English in April, 1776, was attainted of high treason by the Pennsylvania Legislature in July,

and became an interpreter in the employ of the British Indian Department. His name soon became a terror throughout the Western settlements, and innumerable atrocities were attributed to him, though it seems that his influence and position among the Indians were greatly exaggerated, and that he was perhaps never in command of any considerable force. After the Revolution he acted as an interpreter for the English, and was extremely active in instigating the Indians to attack the American frontiersmen. He commanded the Indians who attacked Dunlap's Station, on the Great Miami, in February, 1791; led the Wyandots at the defeat of Saint Clair; commanded the Indians who attacked Fort Jefferson, on the Mississippi, in June, 1791; and in 1794 participated in the battle of Fallen Timbers. During the latter part of his life he lived near Detroit, across the Canadian border. His brothers, George, James, and Thomas, also fought with the Indians against the United States. Consult Butterfield, *History of the Girtys* (Cincinnati, 1890).

GIRVAN, gēr'ván. A seaport town on the west coast of Scotland, 21 miles southwest of Ayr (Map: Scotland, D 4). Weaving, its former leading industry, though still carried on, has been superseded by the winter herring fishery; there is an export trade in coal and limestone from adjacent districts. It has a tidal harbor, and is frequented as a sea-bathing resort. Population, in 1891, 4001; in 1901, 4019.

GISANDER, gē'zan-dēr. The pseudonym of the German author JOHANN GOTTFRIED SCHNABEL (q.v.).

GISBORNE, giz'börn, FREDERICK NEWTON (1824-92). A Canadian inventor and electrician, born in Broughton, Lancashire, England. In 1842 he left England for a trip around the world, and finally settled in Canada in 1845, where he spent two years in farming. In 1847 he entered the employ of the Montreal Telegraph Company as an operator, and in the same year was placed in charge of their new office at Quebec. By close study he soon became an expert electrician, and original improvements in methods and instruments soon attracted so much attention to his work that, in 1849, he received the appointment of superintendent of the lines of the Nova Scotia Government at Halifax. Here he began to study the problems of ocean telegraphy. In 1852 he laid the first deep-sea cable in American waters, between Prince Edward Island and New Brunswick. In 1853 he went to New York City, where he became associated with Cyrus W. Field, and on the organization of the New York, Newfoundland, and London Telegraph Company, was appointed chief engineer of the new company. In that capacity, in 1856, he laid the land-lines across Newfoundland. He was the commissioner for Newfoundland at the London Exposition in 1862, and at Paris in 1865. In 1879 he was appointed superintendent of the Canadian Government telegraph service, which position he held until his death. Among his numerous inventions were an anti-induction ocean cable, electric and pneumatic ship-signals, an anti-corrosive composition for the bottoms of iron ships, and an electric recording target.

GIS'CO (Gk. Γίσκος). The name of three Carthaginian generals. (1) A son of the Hamil-

car who was defeated by Gelon at the battle of Himera (B.C. 480). In consequence of the defeat, Gisco was banished to Selinus, in Sicily, where he died. (2) The son of Hanno. He unsuccessfully opposed Timoleon, after the latter had defeated the Carthaginians at the river Crimissus (B.C. 339). (3) A commander of the Carthaginian garrison at Lilybæum, at the end of the First Punic War. In the year B.C. 241 he was seized and murdered by the mercenary troops who had begun the civil war called the 'Inexpiable,' and with whom the Carthaginian Government had deputed him to treat.

GISELA, gě'ze-là (?-1043). A queen of Germany and Roman empress. As the wife of Conrad II., she was crowned with him at Rome. She exerted a considerable political influence, and was largely instrumental in securing the annexation of Burgundy to the German possessions. Her influence in the Church also was paramount. She was celebrated for her beauty, her generosity, and her profound interest in the affairs of State and of science.

GISLASON, gis'la-sôn, KONRAD (1808-91). An Icelandic philologist, born at Langamyri, and educated at Copenhagen. He was professor of ancient Norse languages at Copenhagen from 1853 to 1886, and became known as a philologist through his excellent editions of the *Gíslasaga* (1849) and the *Njála* (2 vols., 1875-79), and more especially through his Danish-Icelandic Dictionary, which is recognized as an authority on those languages. Gislason bequeathed his entire fortune to the University of Copenhagen.

GISORS, zhě'zôr'. A town in the Department of Eure, France, on the river Epte, 33 miles northeast of Evreux (Map: France, H 2). It contains a richly decorated mediæval church, and in its vicinity on a hill are situated the remains of an old castle constructed by Henry II. of England. The town is famous as the scene of a battle in 1198, when the English under Richard I. defeated the French. In this battle the expression 'Dieu et mon Droit,' which has since become the motto of the royal arms of England, was used for the first time by Richard I. Population, in 1901, 4861.

GISSING, gis'sing, GEORGE (1857-1903). An English novelist, born at Wakefield, Lancaster. He first taught, but afterwards took up literature as a profession, and lived in London. His novels are significant social studies, though somewhat lacking in humor and poetry. They are written from the view-point of a pessimist, with no attempt to suggest a remedy for the evils described. He followed, in a fashion, the large descriptive scheme of Zola and Tolstoy. His works show minutely many phases of contemporary London life. They are essentially novels of disillusionment. His publications include: *The Unclassed* (1884); *Thyrza* (1888); *Life's Morning* (1888); *The Emancipated* (1890); *The Odd Woman* (1893); *Eve's Ransom* (1895)—all treating phases of the sex problem; *New Grant Street* (1891); *Denzil Quarrier* (1892); *The Whirlpool* (1897), a treatment of money in its relation to marriage, one of his most powerful works; *Charles Dickens* (1898); *By the Ionian Sea* (1901), a keen personal record of travel; *Our Friend the Charlatan* (1901), a *tour de force*; and *Demos* (1887) and *The Nether World*, which treat respectively the influence of class

distinction and the industrial problem, probably his best known works.

GITANOS, hê-tâ'nôs. See GYPSIES.

GITSCHIN, gich'in, or **JICIN**, y'chên. A town of Bohemia, Austria, situated on the Cidlina, about 50 miles northeast of Prague (Map: Austria, D 1). Among the noteworthy buildings are the handsome palace built in 1630 by Wallenstein, the former Jesuits' College, now used as barracks, and the fine church dating from 1655. The chief industries are manufactures of sugar and paper, and there is a considerable trade in grain. In the neighboring Carthusian monastery of Walditz Wallenstein was interred, but in 1785 the body was removed to Münchengrätz. Near here, on June 29, 1866, the Prussians under General von Tümping defeated the Austrians and Saxons under Count Clam-Gallas, thus opening the way to a junction of the two Prussian armies, and the subsequent victory of Sadowa. Population, in 1890, 8457; in 1900, 9790, mostly Czechs.

GIUDICI, jō'dê-chê, PAOLO EMILIANI (1812-72). An Italian historian and man of letters. He was born in Sicily, June 13, 1812. During a few months of 1848 he was a professor of Italian literature in the University of Pisa, but was removed because of his liberal tendencies. He was later made professor of æsthetics and secretary of the Academy of Fine Arts at Florence. This second professorship he relinquished in 1862, and in 1867 he was elected a Deputy to the Italian Parliament. He died at Tunbridge, England, September 8, 1872. Giudici's chief works are: *Storia delle belle lettere in Italia* (1844), republished as *Storia della letteratura italiana* (4th ed. 1865); *Storia del teatro in Italia* (1869); *Storia dei comuni italiani* (1866); an Italian translation of Macaulay's *History of England* (1856); and an essay, *Intorno ai poeti lirici d'Italia*, prefaced to the *Floreggio dei lirici più insigni d'Italia* (1846-47). Consult *Biografia di Paolo Emiliani Giudici* (Florence, 1874).

GIUGLIANO, jō-lyâ'nô, IN CAMPANIA. A city in the Province of Naples, Italy, eight miles northwest of the city of Naples (Map: Italy, J 7). It is delightfully situated in a plain that produces grain, vegetables, figs, and other fruit. It has a communal theatre. Population of commune, in 1881, 11,748; in 1901, 14,363.

GIULIANI, jō-lyâ'nê, GIAMBATTISTA (1818-84). An Italian philologist, born at Canelli (Piedmont). He was at different times professor at various colleges in Italy, and in 1860 was made professor of literature at the Istituto degli Studi Superiori of Florence, and a special chair was created for him as lecturer on Dante, of whose works he had made a careful study. Among his writings on this subject are: *Saggio di un nuovo commento della Commedia di Dante* (1845); *Le norme di commentare la Divina Commedia* (1856); *Metodo di commentare la Divina Commedia* (1861); and *Lettere sul vivente linguaggio della Toscana* (1858-65).

GIULIANO DA MAJANO, jō-lyâ-nô dâ mî-nô (1432-91?). A Florentine architect and sculptor in wood, of the Early Renaissance. He was born in Majano, and received his art education in Florence. There is much dispute about his life and work, because Vasari has confused him with Giuliano da Sangallo. We know from

documentary evidence that in 1465 he began the Church of Loreto; that in 1468 he rebuilt the Collegiate Church of San Gimignano; and in 1474 he began the Cathedral of Faenza. In 1477 he was made chief architect of the Cathedral of Florence. He was called to Naples in 1488 by King Alfonso of Aragon, for whom he built the fine Poggio Reale, now destroyed, and the Porta Capuana, one of the most beautiful gates of the Renaissance. He died at Naples after 1491. His best known work, however, is the Palazzo Strozzi, which ranks with the Pitti Palace (q.v.), among the finest palaces of the Early Renaissance in Florence. He was also famous as a sculptor in wood, having executed some of the finest intarsia work in Italy. His works in this line include: the doors of the Sala d'Udienza, in the Palazzo della Signoria, Florence; some decorations in the Sagrestia Nuova, in the Cathedral; the choir-stalls of the Cathedral of Perugia; an intarsia chest in the Cathedral of Loreto.

GIULIARI, jōō'lyā'rè, GIAMBATTISTA CARLO, Count (1810-92). An Italian historian of literature, born at Verona. He studied theology at Rome, and from 1856 until his death he was canon at Verona and librarian of the Biblioteca Capitolare in that city, where he devoted himself almost exclusively to literary work. He had the distinction of having established the first primary schools on Viennese models in his native city (1836). His principal works are: *Memoria bibliografica Dantesca* (1865); *Cinque discorsi dell' Alighieri dalla sua statua in Verona* (1865-68); *Storia della musica sacra in Verona* (1874-79); and *Istoria monumentale letteraria, paleografica della Capitolare Biblioteca di Verona* (1882).

GIULIA (jōō'le-à) **VILLA**, properly, **VILLA DI PAPA GIULIO**. A palace near Rome, built by Pope Julius III. (1550-55). It forms part of a complex of buildings, the *Vigna di Papa Giulio*, situated just to the north of Rome, near the Via Flaminia, and is one of the best examples of the High Renaissance at Rome. According to Vasari, he himself drew the original plans, which were revised by Michelangelo and carried out by Vignola. The villa, however, is probably due in the main to Vignola, but is inferior to his best work. This is especially evident in the façade, which shows repeated change of building plan. The main court is surrounded by semicircular arcades of the Ionic order; adjoining is another court built about a fountain. In the interior of the villa are fine frescoes by the brothers Zuccheri. After the death of Julius III., the building sank into decay, but it has been recently restored, and is now used as a museum of antiquities found outside of Rome. Its treasures are chiefly the results of the Etruscan excavations at Falerii.

GIULINI, jōō'le-né, **GIORGIO** (1714-80). An Italian historian and antiquary, born at Milan. His work on the mediæval history of Milan (1760), based on original research of twenty years, is marked by great learning.

GIULIO ROMANO, jōō'le-ò rô-mā'nò. An Italian painter. See **PIPPI**, **GIULIO**.

GIULIO ROMANO. An Italian singer and composer. See **CACCINI**, **GIULIO**.

GIUNTA, jōōn'tà. **GIUNTI**, jōōn'tè, **ZONTA**, zōn'tà, or **JUNTA**. A family of celebrated

Italian printers, originally from Florence. Two brothers, **LUCA ANTONIO** and **FILIPPO**, were booksellers in Florence as early as 1480; then the elder of the brothers went to Venice and founded a printing establishment which was continued after his death by his son **TOMMASO**, and his cousins. **FILIPPO** (1450-1517) started in Florence a printing house, celebrated for its editions of classics. His sons, **BENEDETTO** and **BERNARDO**, printed Boccaccio's *Decamerone* (1527). Other members of the family went to Rome, and several to Spain, where **GIULIO** and **TOMMASO** were printers to the King (1595-1624). Another, **JACQUES FRANÇOIS JUNTE**, founded a printing house at Lyons (1520), which lasted for a number of years.

GIUNTA PISANO, jōōn'tà pé'sā'nò (c.1202-58). The earliest Italian painter to emerge from the crowd during the period before Cimabue. He flourished between about 1202 and 1258 in Pisa, which was then the art centre of Tuscany. He signed and dated (1236) a "Crucifixion" (his favorite subject) formerly at San Francesco in Assisi. Some authorities attribute to him many of the frescoes in the Upper Church at Assisi, usually thought to be by Cimabue (q.v.). A "Crucifixion" at San Ranieri, an altarpiece in the public gallery, and a scene in the Chapel of the Campo Santo, all at Pisa, are attributed to him, but his work and life remain obscure. If he varies from the Byzantine School in giving dramatic action and pathos to his figures, they seem also to be exaggerated and coarse. Consult: Crowe and Cavalcaselle, *History of Painting in Italy*, vol. i. (London, 1864-66); Thode, *Franz von Assisi* (Berlin, 1885).

GIURGEVO, jōōr-jā'vò, Rum. **GIURGIU**, zhōōr'zhōō. A town of Rumania, in Wallachia, situated on the left bank of the Danube, opposite Rustchuk, 34 miles south-southwest of Bucharest, of which it is the port (Map: Balkan Peninsula, F 3). The chief landing-place for steamers is Smarda, about two miles distant. Giurgevo has a custom-house. The exports consist principally of grain, salt, and petroleum. The annual shipping exceeds 700,000 tons, a considerable portion of which is carried in Austro-Hungarian vessels. Population, in 1899, 13,978. Founded by the Genoese in the fourteenth century, Giurgevo subsequently became an important military post under the rule of the Turks, and was strongly fortified until 1829. During the wars between Russia and Turkey it was the scene of many engagements, and was taken repeatedly by the Russians.

GIURGIU, zhōōr'zhōō. See **GIURGEVO**.

GIUSTI, jōōs'tè, **GIUSEPPE** (1809-50). One of the most celebrated and popular of the modern poets and satirists of Italy, born in Monsummano, near Pistoja. Sprung from an influential Tuscan family, Giusti was early destined for the bar, and at Pistoja and Lucca began the preliminary studies, which were completed at the University of Pisa, where he obtained his degree of doctor of laws. On quitting Pisa Giusti was domiciled at Florence with the advocate Capoguidri, who subsequently became Minister of Justice, and here he first attempted poetry. Lyric compositions of the Romantic School, evincing both elevated and nervous thought, were his earliest efforts; but he speedily comprehended that satire, not idealism, was his true forte. In a

preëminent degree, Giusti possessed the requirements of the great lyrical satirist—terseness, clearness, and brilliancy. His writings exercised a positive political influence. When the functions of the press were ignored, and freedom of thought was treason, his verses in manuscript were in general circulation throughout Italy, and assisted in preparing the insurrection of 1848. Then for the first time did Giusti discard the pseudonym of 'the Anonymous Tuscan,' and append his name to a volume of verses, bearing on the events and aims of the times. In his political poems he abandoned the beaten track, and adopted many metrical forms instead of the conventional *terza rima* or unrhymed hendecasyllables. All his compositions are short pieces, rarely blemished with personalities, and written in the purest form of the popular Tuscan dialect. Giusti's writings are not only Italian in spirit and wit, but essentially Tuscan. A reverent student of Dante, Giusti himself often reaches an almost Dantesque sublimity in the higher outbursts of his wrath, while he stands alone in the lighter play of ironical wit. In politics an enlightened and moderate Liberal, Giusti was also beloved in private life for his social qualities and his loving and gentle spirit. He died in the dwelling of his friend the Marquis Gino Capponi, at Florence. His most celebrated pieces are entitled *Lo stivale*, or the history of a boot (Italy) a humorous narration of all the misfits, ill-usage, and patching allotted to this unfortunate down-trodden symbol of his country; *Gingillino*, a masterpiece of sarcasm, portraying the ignoble career of the sycophant; *Il Re Traviello*, or King Log; *Il Brindisi di Girella*, or the Weathercock's Toast, one of his best pieces, and the *Dies Iræ*, or funeral oration of the Emperor Francis I., written in condemnation of the atrocities committed in the fortress-prison of Spielberg. Several of Giusti's poems have been excellently rendered into English verse by W. D. Howells in *Modern Italian Poets* (1887), and into German by Paul Heyse in *Italienische Dichter*, vol. iii. (Berlin, 1887). Some of the editions of Giusti's *Poesie* are that prepared by Carducci (Florence, 1859; 3d ed. 1879), and several with comments, such as that of Fioretto (Verona, 1876 and since), and that of Bragi (Florence, 1890). Of his prose works, the *Epistolario*, or Correspondence, appeared in a second edition (Florence, 1885); the *Epistolario scelto*, with annotations by Giutini (Naples, 1892). The best biography of Giusti is that prepared by Carducci for his edition of the *Poesie*. Consult also: Carducci's essay on Giusti in his *Primi saggi* (Bologna, 1899); Biagi (editor), *Vita di Giuseppe Giusti* (Florence, 1893), an autobiography; Leonardis, *Il Giusti lirico e il Giusti satirico* (Genoa, 1887); Horner, *The Tuscan Poet Giuseppe Giusti and his Times* (London, 1864).

GIUSTINIANI, joo'stè-nyà'nè. An illustrious Italian family, distinguished in the annals of Venice and Genoa. MARCANTONIO GIUSTINIANI was Doge of Venice from 1684 to 1688, during which time the Venetians temporarily wrested the Morea from the Turks. VINCENZO GIUSTINIANI in the seventeenth century built a magnificent palace among the ruins of Nero's baths at Rome, and stocked it with treasures of painting and sculpture. He also formed a museum of antiquities, discovered on the spot. In 1807 the Giustiniani family conveyed the collection of paintings to

Paris, where they disposed of the greater part by auction, and privately sold the remainder, consisting of 170 fine paintings, to the artist Bonne-maison, who sold them to the King of Prussia. This fragment of the famous Giustiniani Gallery now enriches the Berlin Museum, and a very few of its former treasures are still to be found in the Giustiniani Palace at Rome.

GIUSTINIANI, LEONARDO (c.1388-1446). An Italian poet, born probably at Venice. A humanist and a translator from the Greek, he is best remembered for the *strambotti* and *canzonette* associated with his name. Some of the *canzonette* set to music by Giustiniani himself, and therefore called *Giustiniani*, were popular songs at banquets and upon festive occasions in general. Their subject-matter is erotic, their tone familiar, and their language full of dialectal peculiarities. Consult Wiese, *Poesie edite ed inedite di Leonardo Giustiniani* (Bologna, 1883).

GIVET, zhé'vâ'. A town in the Department of Ardennes, France, on both banks of the Meuse, about 23 miles from the Belgian town of Namur (Map: France, L 1). It was formerly a fortress of considerable strategical value, but in 1892 the fortifications were dismantled, and, with the exception of the citadel of Charlemont, converted into promenade grounds. The town contains a number of breweries, tanneries, pencil-factories, and marble-quarries. Population, 1901, 6947.

GIVORS, zhé'vôr'. A town in the Department of Rhône, France, on the Rhône and the Gier, 14 miles south of Lyons (Map: France, L 6). It contains numerous establishments for the manufacturing of bottles and window-glass, and there are important coal-mines in the vicinity. Population, in 1901, 12,132.

GIZZARD (from OF. *gezier*, Fr. *gésier*, gizzard, from Lat. *gigeria*, cooked entrails of poultry). A strong muscular portion of the alimentary tract, where hard solid food is broken up preparatory to digestion. Gizzards are found in various groups of animals, and have only a physiological likeness. The best known example is that of birds, which is the posterior compartment of the stomach, the front part being glandular and fitted to moisten the food to be crushed. The degree of development of the gizzard of birds depends upon the hardness of the food eaten. Grain-eating birds have the most powerful gizzards; insect-eating birds less powerful ones, while in birds of prey the gizzard is slightly developed. The great anatomist Hunter, indeed, believed that a strong gizzard could be cultivated in carnivorous birds by feeding them on grain, and this has been accomplished in the case of captive gulls. In the gizzard of birds small stones are frequently found, which are swallowed by the bird to aid in triturating its food. Among other animals in which a gizzard has been described are certain Rotifera, Bryozoa, the earthworm, the crayfish and its allies, and various insects, especially such as devour solid food. The 'gizzard' of insects and crustaceans is the fore-stomach or proventriculus; it is by some authors regarded as mainly a strainer. See BIRD; ALIMENTARY SYSTEM.

GIZZARD-SHAD (so called from the shape of its stomach). A name in Florida for the mudshad (q.v.). See PLATE OF HERRING AND SHAD.

GJALLAR, yäl'lär (Icel. *yeller*). The horn which, according to Scandinavian mythology,

Heimdal blows to notify the gods when a stranger is approaching the bridge Bifröst.

GJELLERUP, yel'le-ryup, **KARL ADOLF** (1857—). A Danish novelist, born at Roholte, Zealand. He became a warm advocate of German art and a devoted admirer of Richard Wagner, upon whose famous "Trilogy" he wrote the work entitled *Richard Wagner i hans Hovedværk Nibelungens Ring* (1890). Besides a collection of poems entitled *Min Kjærligheds Bog*, and the dramas *Brynhild* (1884), *Saint Just* (1886), *Thamyris* (1887), *En Arkadisk Legende* (1887), and *Hagbard og Signe* (1888), his works include several admirable tales of travel and the popular novels entitled *Det unge Danmark* (1879); *Germanernes Lærling* (1882); *Minna* (1898); and *Romulus* (2d ed. 1889). His dramas are not well adapted to the stage, because of the deficiency of the dialogues, but his lyrical verses and novels are popular.

GLACIAL DRIFT. See **DRIFT**.

GLACIAL PERIOD, PLEISTOCENE PERIOD, or ICE AGE. A division of geologic time, comprising the earliest part of the Quaternary period. The term gains its significance from a remarkable episode in which abnormal conditions of climate were involved. In late Tertiary times there seems to have been a gradual lowering of temperatures throughout the north temperate zone, and this change progressed steadily until at the opening of the Glacial period the climate was essentially arctic. Within the continental areas enormous glaciers and ice-sheets then formed which advanced southward, filling the river and lake basins, covering the mountains, and burying the lowlands beneath a vast *mer de glace*. One field of ice extended over Canada and the northeastern part of the United States. Its northern limits have not yet been defined, but on the east it reached the Atlantic Ocean, and southward it advanced well into New Jersey, Pennsylvania, and the States between the Ohio and Missouri rivers. New England, New York, and the region of the Great Lakes were completely covered by the ice-sheet. In the White Mountains the rocks bear evidence of having been striated and polished almost to the summits of the highest elevations, and the same phenomena have been recorded for the Adirondacks and Catskills, showing that the ice in places was several thousand feet thick. The mountains of Western North America were also the scenes of great glacial activity, of which the snow-fields of the present day are but wasted relics. Glaciers descended from the Rocky Mountains of Colorado and from the Sierra Nevadas of California far into the river valleys, while those of Alaska and British Columbia were so extensive as to form practically a single field.

The change in temperature seems to have been no less marked in the Old than in the New World. An ice-sheet covered the whole of Northern Europe; it filled up the basin of the Baltic on its way from Scandinavia to the plains of North Germany, and it crossed the North Sea to the Scottish Highlands, whence it moved northward and westward into the Atlantic. The whole of England north of the Thames, as well as Scotland and Ireland, was buried beneath the ice, which attained a thickness in some localities of 5000 feet. On the Continent the sheet spread over Scandinavia, Denmark, Holland, and parts

of Germany, Belgium and Russia, and comprised an area of about 800,000 square miles, or several times larger than the Greenland ice-cap. South of its limits there were smaller snow-fields and glaciers in the Carpathians, Alps, Jura, Pyrenees, and the Central Plateau of France. The present Alpine glaciers are shrunken remnants of the field that covered Switzerland during this period. The high mountain systems of Asia also show evidence of having been glaciated. In the Southern Hemisphere the glaciers of Patagonia were once enlarged so as to extend across the peninsula to the Atlantic shores, and New Zealand was overrun by the ice; but it has not been definitely established that the period of glaciation here was contemporaneous with that of the Northern Hemisphere.

EFFECTS OF GLACIATION. The general configuration of Continental lands has not changed appreciably since the opening of the Glacial period. The mountain systems had acquired their elevation before that time, and, in a general way, the drainage was directed toward the same channels that now carry the surface waters seaward. The ice exerted a powerful influence, however, upon minor land forms or types of scenery. In its progress from north to south and from highland to lowland it pushed along the soil and disintegrated rock, the accumulations of long periods of subaërial decay, and deposited them in great moraines, which still give a peculiar aspect to the scenery of glaciated regions. At the same time the sand and stones incorporated in the mass of moving ice were efficient agents of erosion; rock surfaces, wherever exposed, were smoothed and striated, prominences assumed a more rounded form, and the valleys were widened and deepened. The rock striations show that the direction of flow was influenced by mountain ranges of considerable elevation, although small inequalities in the surface caused no deviation. Most of the lakes in Northern Europe and America had their origin in this period. Lake basins were scooped out by erosion, and temporary lakes were formed by obstruction of valleys during the retreat of the ice-sheet. One of the largest temporary basins, which has been surveyed by means of the old beach lines, extended from the northern parts of Minnesota and North Dakota far into Canada, and covered an area exceeding that of all the Great Lakes combined. All lakes which are of pre-glacial origin show evidence of having been expanded during this period. The Great Lakes are bordered by a succession of terraces, the highest of which stand nearly 500 feet above the present water-level. The ice-sheet for a time stretched across the Saint Lawrence valley, turning the drainage of Lake Ontario into the Mohawk and Hudson; and Lake Michigan, obstructed at its outlet, overflowed toward the southwest into the Illinois River.

A further important result wrought during the Glacial period was the removal of the soil that had been derived *in situ* by weathering, and the substitution of a covering of 'drift' (q.v.). This glacial material was spread very unevenly over the land. In the Laurentian highlands of Canada, where the ice-sheet formed, the surface is bare rock or at most thinly covered with soil. Further south the drift accumulated along lines marking the advance and retreat of the ice in great heaps of boulders, gravel, sand, and clay. Such terminal moraines are strongly developed

in New England, New York, Ohio, and the Northern States as far west as Kansas. A second portion of the transported material was distributed beneath the ice-sheet as 'boulder-clay' (q.v.) or 'till,' in the form of a ground moraine. The boulder-clay is a compact, tenacious clay containing boulders of varying size and generally unstratified, although traces of bedding are sometimes present. It rests directly upon the rock, which is usually smooth and striated. The boulder-clay is distributed unevenly, gathering into smoothly arched ridges and mounds called 'eskers' and 'drumlins' (qq.v.), and at times thinning out so as to leave the rock formations exposed.

The extraordinary changes of climate indicated by the Glacial period led to migrations of the fauna and flora inhabiting the arctic and temperate zones. As the temperature fell, such animals as were unable to endure extreme cold worked southward, while some species found their way from the far north into regions from which they have long since disappeared; remains of the polar bear, reindeer, and Arctic fox occur in the glacial deposits of Southern Europe. With the retreat of the ice, the Arctic fauna and flora were able to adjust themselves to the changing conditions by withdrawing from southern latitudes or by ascending the slopes of mountains. The oscillation of the climate was thus accompanied by a variation of the life forms in each particular region.

DIVISIONS OF THE GLACIAL PERIOD. A detailed study of the Glacial deposits shows that they were not laid down continuously or under uniform conditions. On the other hand, the deposits are frequently divided into sections by intercalated beds of peat, and by stratifications of sands and gravels, which, as they could not have been formed beneath the ice-sheet, lead to the assumption that the ice advanced and retreated more than once. The evidences as to the number and extent of such fluctuations have not, as yet, been correlated successfully for different regions, and there is still much difference of opinion on the subject. Some geologists express the view that the Glacial period was divided into two epochs of cold, separated by an interval of mild temperature when vegetation flourished even in high latitudes. Others hold the opinion that there were as many as five epochs of glaciation and four inter-glacial intervals. A third opinion, which has many claims to consideration, limits the Glacial period to a single climatic revolution, marked by minor oscillations in temperature, and with local variations in ice movement.

CAUSES OF GLACIAL CLIMATE. Various theories have been proposed to account for the cold climate of the Glacial period. A sufficient cause may be found in terrestrial changes, such, for instance, as would lead to a variation in the distribution of land and water. The formation of glaciers is influenced by precipitation and thus by the proximity of warm waters to areas of cold land. It is conceivable that the poles may have been surrounded by a large land area which would exert a cooling effect upon the climate, and that the flow of ocean currents may have been so directed as to increase precipitation, but such a view is unsupported by geological evidence. A second theory, based upon terrestrial changes, ascribes the cold climate to a general elevation of the land surface in the north tem-

perate zone, possibly accompanied by a diversion of the Gulf Stream across the present Isthmus of Central America into the Pacific. This theory fails in the same particular as the first, i.e. there are no evidences of such great vicissitudes. While either of these theories would account for the cold, it is also difficult to bring them into consonance with the view now commonly accepted by geologists, that the Glacial period was marked by periodical variations in the climate. One of the most ingenious explanations that have yet been proposed is based upon the relative positions of the earth and sun at distant periods of time. It is known that the eccentricity of the earth's orbit is subject to secular variations. With a maximum of eccentricity the earth is 14,000,000 miles nearer the sun during perihelion than in aphelion, and the difference in the amount of direct heat received from the sun between these positions is about one-fifth. If now, by precession of the equinoxes, winter in the Northern Hemisphere should occur when the earth is in aphelion, the effect would be to lengthen this season by twenty-two days, and to shorten the summer by an equal period. This coincidence of maximum eccentricity with aphelion winter would undoubtedly result in the refrigeration of the climate in the Northern Hemisphere. This theory, developed by Dr. James Croll, is accepted by many eminent geologists of the present day as the most satisfactory explanation of the Glacial climate.

GLACIER, glâ'shër or glâ's't-ër (Fr., from *glace*, Lat. *glacies*, ice). Many valleys of the Alps and of other high mountain ranges are filled with ice which extends from the snow-fields above to well below the tree-line. This mass of ice is called a glacier. The winter's snow, falling on the lower part of the glacier, melts away the following summer and exposes the ice, which also melts to some extent, and which, if there were not some source of supply, would entirely disappear. In the snow-fields above, the annual snowfall is not all melted in summer, and there is an accumulation of snow. It is evident that in time the snow would grow indefinitely high if there were no means of relief. The necessary relief is found in the flow of the ice, which carries off the surplus snow-fall of the snow-fields, consolidated into ice, to the lower part of the glacier. A glacier, therefore, has two distinct parts—a *reservoir*, where the snow is collected, and a *dissipator*, where the ice is melted. The line separating these two regions is usually

called the *névé*-line. We are thus led to the following definition: A glacier is a body of ice and snow formed in a region where the snowfall is greater than the waste, and flowing to a region where the waste is greater than the snowfall.

DISTRIBUTION. Whenever there is an annual snowfall greater than the annual waste, glaciers must exist. We find them on all high mountains subject to moist winds, such as those on the western coast of North and South America, the Scandinavian mountains, the Alps, the Pyrenees, the Caucasus, the Himalayas, and the mountain chains to the north, and the New Zealand Alps. One glacier is known in Mexico, on Mount Iztaccihuatl, and a number in equatorial Africa, on Mount Kenia, on Mount Kilimanjaro, and on the Ruwenzori range. In the Arctic regions Grinnell Land, Greenland, Iceland, Jan Mayen Land, Spitzbergen, and Franz Josef Land are more or less covered with glacial ice; and the Antarctic lands are almost entirely ice-covered.

CLASSIFICATION. Glaciers may be divided into the following classes:

(1) Continental glaciers, or inland ice, such as the great masses of ice that cover Greenland and the Antarctic Continent. (2) Plateau glaciers, or local ice-caps, are similar to Continental glaciers, but are of comparatively small extent. Examples of this class are found in Norway, in Spitzbergen, and on the borders of Greenland. (3) Alpine glaciers, the more familiar forms, which occupy valleys. (4) Piedmont glaciers. This form occurs when Alpine glaciers debouch and spread out on a plain. The best example is the Malaspina glacier, at the foot of the Saint Elias Alps in Alaska. (5) Hanging glaciers, which rest on shelves on the mountain side. They are usually small and steep. (6) Débris glaciers (*glaciers remaniés* of the French), formed not from snow, but from ice falling from a higher glacier. They are usually small and unimportant.

Glaciers may be complete or incomplete. A complete glacier has a reservoir where the snow is accumulated and a dissipator where the ice is all melted; an incomplete glacier either has its ice supplied directly, as in class 6, or loses some of its ice at the lower end by breakage, as in glaciers which break off at a cliff, or those which reach the sea and form icebergs.

MOTION. If a glacier is in equilibrium—that is, neither growing larger nor smaller—the ice annually flowing through any cross-section of the glacier must exactly equal the total annual accumulation above and the waste below that section. As the accumulation above and the waste below a section through the *névé*-line is greater than for any other section, the flow, under uniform conditions, is the greatest there; and it is less and less through sections more and more distant from the *névé*-line, whether they are higher in the reservoir or lower in the dissipator.

That the ice of glaciers is in motion down the valley has long been known, both from the observation that large stones are carried down on the surface of the ice and from the general reasoning given above. It was not, however, until Agassiz and Forbes began their classical researches that any quantitative value of the motion of the ice was obtained. Since then many measurements have been made on various gla-

ciers, and we now have a fair knowledge of this matter. It has been found that at any section the velocity of the ice is greatest at the centre and diminishes as we approach the sides. When, however, a glacier has a sinuous course, the greatest velocity is not in the exact centre, but is displaced toward the convex side, so that the line of maximum velocity is more sinuous than the glacier itself. The velocity diminishes also from the surface of the ice toward the bed of the glacier. The observations on which this statement rests are neither numerous nor satisfying; nevertheless, they are sufficient to establish the fact. It will appear that, as Forbes said, the flow of a glacier is very much like that of a river; if we consider a river which is flowing into a sandy region, where the water is gradually lost by seepage, the analogy is still more striking. In valley glaciers of fairly uniform slope the velocity is greatest at the *névé*-line and diminishes as we ascend or descend from there. This law is subject to many exceptions; if the valley contracts in descending, there must be an increase in velocity; if the slope of the valley increases, this will also increase the velocity; in glaciers which reach the sea and break off in bergs the velocity increases as we approach the end, as a result of the lack of support in front. There is also a slight movement into the glacier in the reservoir, which is greatest where the accumulation is greatest, and one toward the surface in the dissipator, which is greatest where the waste is greatest. As to actual values in velocities, we find that the Mer de Glace has the greatest velocity of any glacier in the Alps, its maximum amounting to 35½ inches a day. The greatest velocity of the Aletsch, the largest glacier of the Alps, is 20 inches a day. For other Alpine glaciers we find various velocities down to an inch or two a day, or even less for the smaller ones. Of larger glaciers, the Muir in Alaska has a velocity of about seven feet, near where it reaches tide-water; and one of the larger ice-streams of Greenland, the Upernivik, was found to have a velocity of 99 feet a day at one point near its end.

CAUSE OF GLACIAL MOTION. Many theories have been advanced to explain why the ice of glaciers, which is apparently so very brittle, should flow like a plastic substance. There are two questions to be answered—namely, What is the force causing the ice to move, and what property of ice enables it to move as it does? There is a general unanimity at present in the belief that the weight of the ice itself is the only force causing the motion, but there is not so much unanimity in answering the second question. Three explanations still hold their ground: First, according to Forbes and Rendu, the ice, in spite of the fact that it is very brittle to any rapid change of shape, is truly plastic to slow changes; just as shoemaker's wax will break under a sharp blow, but will allow a bullet by its own weight to sink slowly through it. This has been abundantly proved by the experiments of Pfaff, Andrews, Main, McConnell, and Kidd. Experiments on single ice-crystal show that the crystal is plastic in planes at right angles to the optic axis. This is the *plastic* or *viscous* theory. Second, Tyndall considered ice to be devoid of true plasticity, but thought that in a glacier it is continually shattered and refrozen. He was led to this idea by the fact which Faraday dis-

GLACIERS

1. Forno Glacier, Switzerland.

2. Sebree Island, Glacier Bay, Alaska, showing rock glaciated by Muir Glacier when it was larger.

covered, that two pieces of ice when brought into contact will freeze together. He showed by many experiments that ice could be crushed and forced through curved tubes and come out clear ice, the fragments having entirely coalesced. This is the *fracture and regelation* theory. Third, James Thomson discovered that the freezing-point of ice is lowered $.0075^{\circ}$ C. from an increase of one atmosphere of pressure, and applied this fact to the explanation of glacial motion. He supposed that at any point, where, by the movement of the ice, the pressure becomes a little greater than the average, the freezing-point will be lowered and a small amount of ice melted; the pressure being thus relieved, the ice will move slightly, and the pressure will be transferred to other points; the water thus formed will be squeezed through crevices in the ice to other points where the pressure is less, and will there freeze. A continuation of this process will result in the general progression of the ice down its valley. This is the *pressure and regelation* theory.

CREVASSES. Although the ice of glaciers can suffer some distortion without breaking, if the rate of distortion is too great the ice will crack and great crevasses form. Crevasses can be divided into distinct classes: *Marginal* crevasses, which occur on the sides of glaciers and point upstream at an angle of about 45° ; they are the result of increasing velocity from the sides to the centre of the glacier. There must also be a tendency to the formation of crevasses at the bottom of the glacier pointing up-stream, but it is extremely probable that the weight of the ice is sufficient to prevent their forming except occasionally very near the end of the glacier. *Transverse* crevasses are formed when the slope of the bed increases. *Longitudinal* crevasses form near the end of the glacier, especially when the ice spreads out on a plain; they are due to the pressure of the ice behind and are usually arranged radially. Irregular crevasses may be formed as the result of some irregularity in the bed of the glacier. There is usually a very large crevasse, called the *bergschrand*, at the upper margin of the reservoir; it is due to the more rapid motion of ice of the reservoir pulling it away from the ice clinging to the mountain slopes. In the dissipator the crevasses are in full view, but in the reservoir they are frequently covered with snow; this makes traveling above the snow-line very dangerous, except for parties of several persons properly roped together. When

crevasses first form they are mere cracks, which afterwards widen out as the result of the motion of the ice and the melting of their sides, until they sometimes are fifty or even a hundred feet wide. They may be half a mile or more in length, but the great depths which they are supposed to reach are exaggerated; they are rarely so much as 200 feet deep, and probably never as deep as 300 feet.

MORAINES. The rocks and debris which fall upon the surface of the glacier and are carried down by it, and the material pushed along under the ice, are called *moraines*. They cannot be seen in the reservoir, as they are there covered by the snow, but they are very striking features of the dissipator. *Lateral* moraines are formed by the rocks falling from the mountains upon the sides of the glacier. When two tributary glaciers unite to form a trunk glacier, two of the lateral moraines unite to form a *medial* moraine, which from a distance looks like a great dark line drawn upon the surface of the white ice marking out the direction of motion. The ice under the moraine, being protected from the air and sun, does not melt as rapidly as the unprotected ice, and, therefore, is left by the general waste of the surface as a great ridge rising sometimes a hundred feet above the general level of the ice. *Reservoir* moraines, so called from their origin, are formed by material falling upon the reservoir where it is covered by the snow and later brought to the surface of the dissipator by the motion of the ice and the melting. Moraines which can hardly be distinguished from reservoir moraines may sometimes be formed from the material plucked from a projecting point in the bed of the glacier and carried along in the body of the ice, to be exposed later at the surface by the melting. The material pushed along under the ice is called the *ground moraine*; it is made up of debris fallen under the glacier at the sides or through crevasses or the *bergschrand*, and material plucked from the bed of the glacier.

STRUCTURE OF THE ICE. The origin of the glacial ice is the snow that falls in the reservoir. By thawing and freezing, this soon changes into a turbid ice filled with many air-bubbles. Crystallization starts from numerous centres, around which the molecules of ice gradually rearrange themselves until the whole mass is made up of crystals of clear ice (though still containing many air-bubbles) with their respective optical axes turned in various directions. The crystals at this stage are about the size of peas and adjoin each other in surfaces which bear no relation to the geometric crystalline faces. By a process of recrystallization some of these crystals grow at the expense of their neighbors until finally many of them become four or five inches in diameter. During this process the ice is moving down the valley, so that we find the crystals of increasing age, and therefore increasing size, mixed in with smaller ones as we go from the *névé*-fields down the glacier. The sun's rays penetrating the ice for a short distance melt the ice along the junctions of the crystals, which can then readily be separated. The sun's rays also cause melting in the interior of the crystals at various points; the cavities thus formed are flat disks or six-angled stars; as the water occupies less space than the ice from which it was melted, each of these cavities contains a small vacuum which is

more easily visible than the sides of the cavity. These cavities are known as Tyndall's figures, and always lie with their flat sides at right angles to the optical axis of the crystal, whose direction may thus be easily determined.

STRATIFICATION AND BANDED STRUCTURE. On the sides of crevasses in the reservoir the layers of hardening snow, due to successive seasons, can be readily distinguished, and the outcrops of these strata can be followed for a short distance into the dissipator; but their appearance soon changes, and the majority of observers claim that as the ice becomes consolidated the marks of stratification are obliterated. In the lower part of the dissipator, where the ice is thoroughly consolidated, it is found to be composed of bands of bluer and whiter ice, the color being caused by the amount of the contained air-bubbles.

LONGITUDINAL SECTION OF GLACIER.

These bands, as described by Forbes and others, follow the general shape of the bowl of a spoon pointing down-stream. Each tributary has its own system of bands, though but one system is usually found at the end of the glacier. They are prominent at the sides, near the end, and at the line of junction where two glaciers unite. Three explanations have been given of their origin. Agassiz considered them the modified form of stratification. Forbes looked upon them as surfaces where the principal amount of differential motion took place. Tyndall thought they were caused by pressure and were analogous to the slaty cleavage of rock. Forbes's idea has been practically discarded, and glacialists are divided between the explanations of Agassiz and of Tyndall.

TEMPERATURE. Theory, and, so far as they go, observations indicate that the body of the glacier is at the temperature of melting ice.

VARIATIONS. The relative sizes of the reservoir and dissipator are determined by the condition that the accumulation in the first must equal the waste in the second. The accumulation depends upon the size of the reservoir and the snowfall, and the waste on the size of the dissipator and the rate of melting. The melting is due principally to direct radiation from the sun and to condensation of water vapor from the air; it will readily be seen that in cold wet periods glaciers will advance, and in warm dry periods they will retreat. Glaciers are, therefore, indicators of climatic variations. In the last twenty years much attention has been given to the study of the variations of glaciers. It has been discovered that in the Alps the glaciers have made no permanent change within the last three hundred years, but that they have grown larger and smaller in size, making a complete fluctuation on the average once in thirty-five years. Records of the glaciers of Iceland and of Scandinavia show that in the seventeenth century they were much smaller than they are at present; early in the eighteenth century a general advance began which continued well into the nineteenth century, and

was characterized by a very marked increase in the extent of the ice; since then there has been a small retreat. The same general order has been followed in southeastern Alaska, though the dates cannot be definitely determined. It is probable that the glaciers of other Arctic regions have experienced similar variations. With few exceptions, the glaciers in all parts of the world are now in retreat.

WORK OF GLACIERS. The moraines are carried along by the glaciers and deposited on the sides of its valley and at the end of the ice. Some rocks become imbedded in the ice and act like graving-tools in making long, straight scratches in the bed-rock, whose surface is also smoothed by finer material moved by the ice. A region which has been covered by a glacier usually shows smooth and rounded rock surfaces marked with parallel scratches; heaps of rocks, more or less angular, and dumped irregularly about, frequently forming small lakes. These rocks are often of a different kind from the underlying country rock, showing that they have been transported from a distance, and their angular or subangular forms show that they have not been transported by water. They are called *erratics*. Among them some will have smoothed and scratched surfaces. It is by studying the distribution of scratches, smoothed surfaces, and erratics, that geologists have been able to show the existence of a former ice age when large parts of Europe and of North America were covered by great sheets of ice.

The power of glaciers to erode valleys or lake basins has been greatly discussed, without a conclusion commanding general assent being reached. Leading geologists entertain diametrically opposite opinions on this subject.

Prussian Rhine Province, 16 miles west of Düsseldorf (Map: Germany, B 3). The Münsterkirche is a fine old structure with a Gothic choir dating from the twelfth century, and an eighth-century crypt. There are three monasteries, a synagogue, and a teachers' seminary. Gladbach is the centre of a textile industry in the Rhine Province. There are numerous spinning, weaving, and dyeing establishments, foundries, machine-shops, book-binders, and many establishments for the manufacture of soap, shoes, chocolate, confectionery, wagons, brushes, paper, leather, furniture, etc. The number of persons employed in the manufacturing of the town is over 16,000. Gladbach had its origin in the Benedictine abbey founded originally in the eighth century, and abolished at the beginning of the nineteenth. Population, in 1890, 49,628; in 1900, 58,023; including over 9000 Protestants.

GLADDEN, WASHINGTON (1836—). An American clergyman and writer, born in Pottsgrove, Pa. He prepared for college at the Owego Academy, in Owego, N. Y., and graduated at Williams in 1859. He was pastor of Congregational churches in Brooklyn, N. Y., Morrisania, N. Y., North Adams, Mass., and Springfield, Mass., from 1860 until 1882, when he removed to Columbus, Ohio, to become pastor of the First Congregational Church there. As an editor he was connected with the *Independent* from 1871 to 1875, and with the *Sunday Afternoon* (Springfield, Mass.) from 1878 to 1880. He was given the degree of D.D. by Roanoke College, Virginia, and LL.D. by the University of Wisconsin and Notre Dame University, Indiana, a Catholic institution. His pulpit and published utterances show vigorous, direct, and practical thought, and the gift of graceful expression, and he put into practice his repeated expression about the duties of citizenship by serving in the City Council of Columbus from 1900 to 1902. His books, which are sensible and scholarly discussions of social and civil reform, and of the application of Christianity to every-day life, include such titles as: *Plain Thoughts on the Art of Living* (1868); *Workingmen and Their Employers* (1876); *Being a Christian* (1876); *The Christian Way* (1877); *The Lord's Prayer* (1880); *The Christian League of Connecticut* (1883); *Things New and Old* (1884); *The Young Men and the Churches* (1885); *Applied Christianity* (1887); *Parish Problems* (1888); *Burning Questions* (1889); *Who Wrote the Bible?* (1891); *Santa Claus on a Lark* (1892); *Tools and the Man* (1893); *The Cosmopolis City Club* (1893); *The Church and the Kingdom* (1894); *Ruling Ideas of the Present Age* (1895); *Seven Puzzling Bible Books* (1897); *Social Facts and Forces* (1897); *Art and Morality* (1897); *The Christian Pastor* (1898); *How Much is Left of the Old Doctrines* (1899); *Social Salvation* (1902); and *The Practice of Immortality* (1902). He also wrote the discussion of the Christian religion, "The Outlook for Christianity," in *Great Religions of the World* (1902).

GLADHEIM, glád'hím (Icel., bright abode). In Norse mythology, the dwelling-place of Odin, the largest and noblest of edifices. In this home is Valhalla (the hall of heroes), radiant with gold, to which are conducted all who fall in battle. The ceiling is formed of spears, the roof of shields, and the benches are strewn with coats of mail. According to the *Elder Edda* it has 540

gates, through each of which 800 men can go abreast.

GLADIATOR (Lat., swordsman). One who in antiquity fought in the arena, at the amphitheatre in Rome, and in other cities, for the amusement of the public. The gladiators were generally slaves, bought and trained for the purpose, by masters who made this their business. The custom is supposed to have been borrowed from the East, and to have had its origin in the practice of human sacrifices, or that of taking the lives of captives or prisoners of war, in honor of heroes who had died in battle.

After a time all considerable funerals were solemnized by human sacrifices, which took the form of combats, in which, to increase the interest of the spectators, the prisoners were required to sacrifice each other; and as prisoners, and afterwards other slaves, were kept for this purpose, they were trained to fight with skill and courage, to make the spectacle more impressive. These contests first took place at funerals, but afterwards in the amphitheatre, and in process of time, instead of a funeral rite, became a common amusement. The first we read of in Roman history was the show of a contest of three pairs of gladiators, given by Marcus and Decimus Brutus, on the death of their father, in the year B.C. 264. In the year B.C. 207 a show of twenty-two pairs was given in the Forum. In B.C. 217 the first Scipio Africanus diverted his army at New Carthage with a gladiatorial exhibition. The fashion now rapidly increased. Magistrates, public officers, candidates for the popular suffrages, gave shows to the people, which consisted chiefly of these encounters. The emperors exceeded all others in the extent and magnificence of these spectacles. Julius Cæsar gave a show of 320 pairs; Titus gave a show of gladiators, wild beasts, and sea-fights for 100 days; Trajan gave a show of 123 days, in which 2000 men fought with and killed each other, or fought with wild beasts for the amusement of the 70,000 Romans, patricians, and plebeians, the highest ladies and the lowest rabble, assembled in the Coliseum. A vast number of slaves from all parts of the world were kept in Rome, and trained for these exhibitions. There were so many at the time of Catiline's conspiracy that they were thought dangerous to the public safety, and it was proposed to distribute them among the distant garrisons.

Efforts were made to limit the number of gladiators, and diminish the frequency of these shows. The Emperor Augustus forbade more than two shows in a year, or that one should be given by a man with a property of less than half a million sesterces; but it was difficult to restrain what had become a passion, and men even had such contests for the amusement of their guests at ordinary feasts.

These shows were announced by show-bills and pictures, like the plays of our theatres. The gladiators were trained and sworn to fight to the death. If they showed cowardice, they were killed with tortures. They fought at first with wooden swords, and then with steel. When one of the combatants was disarmed, or upon the ground, the victor looked to the Emperor, if present, or to the people, for further directions: if they turned up their thumbs, the act signified death; contrary to the popular notion, mercy

was indicated, not with the thumbs at all, but by a waving of handkerchiefs. A gladiator who had conquered was rewarded with a branch of palm, and sometimes with his freedom. Though the gladiators at first were slaves, freemen afterwards entered the profession, and even knights. Senators and knights fought in the shows of Nero, and women in those of Domitian. The Emperor Constantine prohibited the contests of gladiators, A.D. 325; but they could not at once be abolished. In the reign of Honorius a monk, Telemachus, went into the arena to stop the fight, but the people stoned him. They were finally abolished by Theodoric (A.D. 500).

GLADIATOR, THE. A tragedy by Robert Montgomery Bird (1841), in which Edwin Forrest frequently took the part of Spartacus.

GLADIATORS' WAR. See SPARTACUS.

GLADIOLUS (Lat., diminutive of *gladius*, sword; so called from the form of the leaves). A genus of plants of the order Iridaceæ, with a tubular perianth, the limb of which is divided into six unequal thread-like segments; the stamens are undivided; and the seeds are winged. The roots are bulbous; the leaves linear or sword-shaped. The Cape of Good Hope produces the greater number of the known species, as also several allied forms once included in this genus. A few, however, are natives of other countries, and two or three are found in Europe. Most of the species have flowers of great beauty; and some of them are among the finest ornaments of flower borders and greenhouses. They are propagated either by seed or by offset corms; and in the former way many new varieties have been produced. In the garden culture of gladiolus the corms are planted out in early spring, preferably in sandy loam soil. The flowers open in July and August, and the blooming season can be prolonged by successive plantings in spring and early summer. In the fall the corms are dug and kept in a cold cellar over winter. Some very remarkable hybrids have been produced by Lemoine in France and by Groff of Canada. Formerly Southern Europe supplied the world with gladiolus, but the United States supplies the great bulk of the crop. The gladiolus fields of Long Island, N. Y., are perhaps the most noted in the world.

GLADSTONE, HERBERT JOHN (1854—). An English politician, fourth son of William Ewart Gladstone. He was born in London, was educated at Eton and at University College, Oxford; was lecturer on modern history at Keble College from 1877 to 1880, and was private secretary to his father in 1880-81. From 1881 to 1885 he was Junior Lord of the Treasury, and subsequently acted as financial secretary of the War Office (1885). Under Home Secretary (1892-94), and First Commissioner of Works (1894-95). He was a member of Parliament for Leeds from 1880 to 1885, since which time he has represented Leeds, West.

GLADSTONE, WILLIAM EWART (1809-98). A British statesman. He was born December 29, 1809, of Scotch parentage, in the city of Liverpool, where his father was a wealthy merchant, a member of Parliament, and a baronet. In 1821 he was sent to Eton, and in 1828 he entered Christ Church College, Oxford. Both at Eton and Oxford Gladstone was distinguished for ap-

plication to his studies, for his religious tendencies, his love of outdoor life, and his fondness for oratory and debate. He was successively secretary and president of the Oxford Debating Union, and in that society he delivered a powerful oration against the Reform Bill, which had been introduced into the House of Commons in 1831. In that year he took a double first in classics and mathematics.

Gladstone left Oxford in the spring of 1832, and after spending six months in Italy, entered Parliament as a member for Newark. The House of which he was a member was the first to be seated under the Reform Bill, which he had attacked while in college. He naturally attached himself to the Tory opposition under Sir Robert Peel, and waited for that party to come into power to win advancement. He delivered his maiden speech on June 3, 1833, in vindication of his father from charges brought against him concerning his conduct toward the slaves on his plantation in Demerara. In the last week of 1834 Peel came into power, and in January, 1835, appointed Gladstone First Junior Lord of the Treasury, and in the following month Under-Secretary for the Colonies. The Parliament elected in February, however, had a Liberal majority; on April 8th the Tory Government went out and Gladstone again became a private member, which he remained until 1841, when, on Sir Robert Peel's coming back into power, he was appointed vice-president of the Board of Trade and Master of the Mint. In May, 1843, he became president of the Board of Trade, and so gained his first seat in a Cabinet. Both as vice-president and as president he took a leading share in the work of reforming the tariff, and thus got his first lesson in finance. Already he gave unmistakable signs of genius in this direction, both in the work of arranging schedules and in the defense of his proposals on the floor of the House in exposition and debate. For a moment he endangered his career by resigning his office through uncertainty as to the support he should give an important Government measure concerning an increased grant to Maynooth College, the Irish training school for Catholic priests. To Gladstone this seemed opposed to the principles he had supported in a book on the relations of the Church and State, published by him in 1839, in which he had stood for a single Church establishment under the control of the State, of which it should be the conscience. Rather than run the risk of compromising himself before his own conscience he resigned his office (January 28, 1845) and became once more a private member of the House.

In December, 1845, he was appointed by Peel to the office of Colonial Secretary. To accept this he had to vacate his seat. This was the one break in a Parliamentary career extending over more than half a century. Gladstone now gave Peel his assistance in formulating his free-trade measures which led to the repeal of the Corn Laws in 1846. In 1847 Gladstone resumed his seat in the House as Tory member for Oxford. In 1850 Peel died, and the first period in Gladstone's career, the period of apprenticeship to this great master, was terminated.

The new period extending from 1850 to 1868 may be called Gladstone's period of independent political reform. In 1852 he first came into conflict with his great rival, Disraeli, whose budget in that year he completely annihilated, thus

WILLIAM EWART GLADSTONE
FROM A PHOTOGRAPH TAKEN IN 1896

bringing about the fall of the Derby Ministry (December 17th). In 1853 he presented his own first budget as Chancellor of the Exchequer in Aberdeen's Coalition Cabinet, and scored the first great personal triumph of his career. This budget was a masterpiece of equable and efficient taxation. It increased the revenues of the State and placed the burden of the impositions where they could best be supported. His plans, however, especially in the matter of the income tax, which he was proposing by gradual steps to abolish completely, were somewhat interfered with by the intervention of the Crimean War, which demanded a new budget with increased taxation. In this budget Gladstone insisted that all the funds needed for the prosecution of the war should be raised by taxation, and not by the negotiation of loans. The conduct of the war, however, hurt the prestige of the Aberdeen Government, and on January 29, 1855, the Ministry resigned. But Gladstone was the 'inevitable' Chancellor for any administration, and he accepted the same office in Lord Palmerston's Cabinet, resigning it, however, at the end of three weeks. He remained out of office for three years, during which time he published his *Studies on Homer* (1858), and undertook a mission to the Ionian Islands, where a strong agitation was being carried on for the cessation of British rule and annexation to Greece. In 1859 he returned to the Exchequer in the Cabinet of Lord Palmerston, and in 1860 and 1861 he issued budgets that were marvels of financial statesmanship. He had now allied himself completely with Bright and Cobden, the latter of whom he had heartily supported in his attempt to negotiate a commercial treaty with France. This was accomplished in January, 1860. By his masterly tactics Gladstone won a complete victory over the House of Lords in 1861 after it had defeated his measure for the abolition of the tax on paper in the previous year. This was a great victory for popular education and the free press, and from that time dates the era of cheap newspapers for the people in England.

In July, 1865, Gladstone was defeated for Parliament at Oxford, but was returned from South Lancashire. Lord Russell became head of the Ministry, and made Gladstone Chancellor of the Exchequer and leader in the House of Commons. In 1866 Lord Russell brought forward his first bill for the extension of suffrage and the redistribution of seats in the House of Commons. The support of this measure marks the beginning of Gladstone's adhesion to the Liberal Party, toward which he had long been tending. His acceptance of office under Palmerston while still professing Tory principles was the first step in this direction. His defeat by his Oxford constituents because of his Liberal affiliations and tendencies strengthened his resolution to make his abandonment of Toryism definite. As for the bill itself, Disraeli and others united to defeat it, and the Liberal Government was forced to resign (June 19th). Lord Derby and Disraeli on their accession to power introduced another reform bill even more radical than that of Gladstone, who gave the new measure his hearty support, helping to carry it through in 1867.

In December, 1867, Gladstone succeeded Lord Russell as leader of the Liberal Party. In this capacity he vigorously assailed the Conservative Ministry, which after February 26, 1868, was

headed by Disraeli. In November the Ministry appealed to the country on the question of the disestablishment of the Irish Church, which had been made by Gladstone a party issue, and in the new Parliament the Liberals gained an overwhelming majority. On December 4, 1868, Gladstone became Prime Minister, and started in at once on a campaign of reform in Irish affairs. The disestablishment of the Irish Church was effected in July, 1869, after a bitter struggle in the House of Lords. The next thing he essayed was to reform the Irish land system. This bill, though moderate in character, was nevertheless a step forward in the direction of giving the tenants more rights and keeping them from being crushed at pleasure by their landlords. This bill was carried in 1870. He also sought to establish an Irish National University that would satisfy the just demands of the Catholics of Ireland. This measure was defeated and he resigned (March, 1873). Disraeli refused to form a Ministry, so Gladstone was forced to resume office for a time, though his strength was insufficient to carry any important reform measure. In 1874 he called for a dissolution in order to increase, if he could, the strength of his party in the House by a general election. The election brought defeat instead, and Disraeli returned to power. Gladstone, wearied with the weight of affairs, resigned his leadership and retired from official life to carry on a controversy over the Vatican decrees recently promulgated by the Pope, and destined, as Gladstone thought, to weaken the allegiance of English Catholics to their sovereign.

It was the news of the Bulgarian horrors (1876) that brought Gladstone once more into public life. By his speeches and pamphlets he aroused public feeling to the highest pitch of excitement, and throughout the Russo-Turkish War he denounced the pro-Ottoman policy of Lord Beaconsfield, acting once more as the leader of his party. On the issue of the Russo-Turkish War the Liberals carried the country in 1880, and Gladstone, elected from Midlothian, on April 23 became Prime Minister. Gladstone now resumed his position at the head of the Liberal Party. He started in at once to continue the work of his first Ministry. He introduced a second Irish Land Bill, which was thrown out of the House of Lords. Ireland began to grow impatient, and the Nationalist leaders in Parliament restive. The Home Rule movement took a new lease of life under Parnell, Dillon, and others, but as yet Gladstone had nothing in common with their cause. His Ministry lost prestige in the conduct of affairs both in Ireland and abroad. The Phoenix Park murders (1882), followed by repressive legislation on the part of the Government, alienated the Irish members in Parliament. The defeat of Majuba Hill (1881), and the generous terms of peace conceded the Boers, aroused public dissatisfaction. The failure to relieve Khartum, and the tragic death of General Gordon (1885), were fatal blows to the Ministry. On June 8, 1885, Gladstone resigned and was succeeded by Lord Salisbury. The elections of November showed a slight preponderance of Conservatives and Parnellites over Liberals. To gain the support of the latter, Gladstone announced his adhesion to Home Rule; the Conservative Government was overthrown, and on February 1, 1886, Gladstone

succeeded to the Premiership for the third time. In April a Home Rule bill was brought into Parliament. (See HOME RULE.) The measure met with opposition from all sides. The Irish members objected to the clause which deprived Ireland of representatives to the Imperial Parliament. A serious defection occurred in the Liberal ranks, Lord Hartington and Mr. Goschen refusing to support the Government, and being supported in their action by John Bright and Joseph Chamberlain. On June 7th the bill failed to pass a second reading, 93 Liberal votes being cast against it. Parliament was dissolved on June 26th, but the elections resulted in the decisive defeat of the Liberal Party, and on July 20th the Ministry resigned. The elections of 1892 showed a majority of 40 for Home Rule, and on August 15th began Gladstone's fourth and last Ministry. In 1893 a new and amended bill was brought before the House, and Gladstone, making the last great official fight of his life, triumphantly carried it. The House of Lords, however, threw out the measure (September 8th), and the last stage of Gladstone's life work ended in apparent failure. Weary of the tumults of Parliamentary life, he laid down his office on March 3, 1894, being succeeded by his colleague Lord Rosebery.

The last participation of Gladstone in public affairs was in connection with the Armenian massacres in 1896. He addressed meetings throughout the country and aroused public feeling, as he had done in 1876 over the Bulgarian atrocities. In 1898, on the 19th of May, he died in the eighty-ninth year of his life. He lies buried in the statesmen's corner of Westminster Abbey.

Gladstone was the greatest of the long line of Victorian political leaders and prime ministers. His only rival was Disraeli; but he had moral qualities which Disraeli lacked, and these more than made up for the superior brilliancy of the other, who looked with some contempt on Gladstone's principles and seriousness. Gladstone has been called an opportunist, and it is true that he more than once changed his position and went over to those against whom he had fought previously; but for any one who has studied Gladstone's career carefully these changes were not without a law of their own in Gladstone's intellectual development. Each change bore a relation to a previous change, and viewing his career in the large we perceive a steady, gradual, and consistent progress. This is more than can be said of Disraeli, who, reversing his position quite as completely as Gladstone, did it to serve his own private ambitions. Gladstone cared too little for power, refused office too often, and increased the anger of his constituents too readily by disregarding their wishes in matters of foreign and domestic policy, for it to be thought that he would ever have sacrificed his convictions to insure his own success. It was against his inclinations that he had entered public life in the first place. If once in the battle he stayed there, it was from a sense of duty characteristic of his moral seriousness. He always preferred his leisure, and more than once he withdrew from public affairs only to reënter the arena at the first recall.

Little has been said of Gladstone's literary labors, which were enormous. He was a scholar of the old type, caring only for literature and

nothing for natural science. Many of his ideas were antiquated, for in literature he always remained the Tory, whatever he became in politics; that is to say, he believed in the principle of authority. To him the Bible was always the word of God and the law of Moses the law of Moses, while Homer was a real man describing real historic events. Still it is well to remember that Gladstone stood for an attitude toward the classics and the Scriptures which is associated with the high influence these works of antiquity have had for the race's civilization. There is something to be said for Gladstone's conservatism, perhaps even as against his radicalism in politics.

As to what Gladstone accomplished with his reforms in politics, it is too early to pass a complete judgment. The work which occupied him during the whole of the third period of his life is yet unfinished. His Irish land bills were partial measures only, and the principle of Home Rule needs still to be applied to show whether Gladstone was right or not in believing that therein lay the panacea for Irish evils. It is as a reformer in finance and as a defender of the liberties of all classes of the English people that he stands forth most strikingly in history. Free trade, equal taxation, popular education, manhood suffrage, these are the great causes with whose beneficial results he is identified to his greatest glory. It is in his foreign policy that he was weakest. Domestic questions interested him almost to the exclusion of foreign matters, excepting when a race or a nation was suffering from oppression or tyranny. The wrongdoings of the Turks in particular called forth his denunciation, and he was always preaching, as it were, a holy war against the Moslem. He contributed to the independence and union of Italy by his letter about the political crimes of the rulers of the Two Sicilies. Mention has been made of his efforts on behalf of Bulgaria and the Armenians. On the other hand, because he cared nothing for foreign policies as such, or for England's national prestige, he incurred the opprobrium of the people through what appeared to be his neglect of Gordon at Khartum, his submission to the Boers in South Africa, his willingness to submit to arbitration with the United States, and other matters in all of which he was content if he could avoid war and maintain an honorable peace. Personally Gladstone was a man full of charm and grace in his early years, and full of dignity and grandeur in his old age. The leading figure in Parliament for so many years, Justin McCarthy spoke well when he said that the House of Commons was no longer the same place without him.

Gladstone contributed articles on literary and political topics to the *Quarterly Review* and other magazines. Most of these were published under the title, *Gleanings from Past Years* (8 vols., 1879-90).

In 1839 Gladstone married Catherine, the elder daughter of Sir Stephen Richard Glynne of Hawarden Castle. She died on June 14, 1900. Four sons and four daughters were born, of whom the eldest, William Henry Gladstone, died in 1891, after sitting in Parliament from 1865 to 1885; Stephen Edward Gladstone is rector of Hawarden; the youngest son, Herbert John, became member of Parliament in 1890. The youngest

daughter, Helen, became principal of Newnham College, Cambridge.

GLAGOLITSA, glā-gō-l'ětsā. One of the old Slavic alphabets, which contains characters arranged in the same order as in the Kirillitsa (q.v.). The shape as well as the numerical value of its letters is different from that of the Kirillitsa. The name is not derived from the fourth letter of the alphabet, *glagol*, but it is so called, since it is a collection of significant, telling signs (from OChurch Slav. *glagolati*, to speak). Kirillitsa is chronologically an earlier name, but there are good reasons to believe that it was the original name of what is now known as Glagolitsa. Jagie upholds the theory that Cyril invented Glagolitsa, and that his pupil, Saint Clemens, transformed it into Kirillitsa. Taylor (*Archiv für slavische Philologie*, vol. v., Leipzig, 1881) and Jagie derived it from the cursive Greek (not uncials) of the eighth and ninth centuries. Only the following can be set down as positive facts: Glagolitsa began to spread not later than Kirillitsa, among both the Southern and the Western Slavs. Then it went out of use completely in the South; in the West it was also superseded by the Roman alphabet in Bohemia; while in Croatia and Dalmatia it long maintained its existence with difficulty, and Pope Leo XIII. shortly before his death sanctioned the publication of ecclesiastical books in Glagolitsa characters. The Bulgarian ductus of the Glagolitsa is round, while the Croatian is more angular. The earliest Glagolitic manuscript extant belongs to the eleventh century. It is in the collection of Count Clotz, published at Vienna by Copitar in 1836 and known as *Glagolitsa Clotzianus*. On account of the difficulty of reading, the Glagolitic monuments are usually printed transliterated in the Cyrillic alphabet.

GLAIS-BIZOIN, glā'bē-zwān', ALEXANDRE (1800-77). A French legislator, born at Quintin (Côtes-du-Nord). After participating in the opposition to the Government of the Restoration, he was elected Deputy to the Chamber in 1831, and successively served in that capacity for seventeen years, when he became a member of the Moderate Republican Party in the Constituent Assembly. He subsequently served in the Corps Législatif from 1863 to 1870, in which year he was appointed a member of the Provisional Government. In May, 1871, he was arrested and imprisoned for a short time during the reign of the Commune. His *Dictature de cinq mois* (1872) discusses the national defense during the Franco-German War.

GLAISHER, glā'shēr, JAMES (1809-1903). An English scientist and aeronaut. His remarkable

ascent to 37,000 feet is recorded as the greatest effort of balloon ascension. He held many important positions, and published numerous books and papers on various topics connected with the mathematical sciences. His best known work is *Travels in the Air* (1880).

GLAIZE, glāz, AUGUSTE (1807-93). A French painter, born at Montpellier. He studied painting and lithography in Paris as the pupil of Eugène and Achille Devéria. After a few early works, such as "Dante Writing His 'Divine Comedy'" (1847), he turned his attention to the representation of abstract ideas in philosophy and ethics. His most important canvas in this manner is "The Drama of Human Folly" (1872). His work displays powerful color-effects and abundant invention. He further executed several frescoes in the churches of Saint-Sulpice (1859) and Saint-Jacques du Haut Pas (1868).

GLAIZE, PIERRE PAUL LÉON (1842-). A French painter, born in Paris. He was the son of Auguste Glaize (q.v.). Young Glaize studied under his father and Gérôme at the Ecole des Beaux-Arts. His works include: "The Treason of Delilah;" "Samson Taken by the Philistines;" "Æsop at the House of Xanthus" (which shows the influence of Gérôme); and "An Early Roman Conspiracy." The coloring in these works is strong and effective. He also painted scenes from the life of Saint Francis Xavier in the Church of Saint Merri, Paris.

GLAMMIS (glāmz) **CASTLE**. The imaginary scene of the murder of Duncan in Shakespeare's *Macbeth*. It is an ancient castle, the seat of the Earl of Strathmore, near Strathmore, Scotland, and is a fine example of the Scotch baronial castles.

GLAMORGANSHIRE (Welsh *Gwlad Morgannwg*). The southernmost county of Wales, bounded on the north by the county of Brecon, on the east by Monmouth, on the south and southwest by the Bristol Channel, and on the west by the county of Carmarthen (Map: Wales, C 5). The county is remarkable for its coalbeds and the great development of the iron industry. It also produces a considerable amount of grain, as well as large numbers of cattle, sheep, horses, and hogs. The chief towns are Cardiff, the capital, Merthyr-Tydvil, and Swansea. Population, in 1891, 687,200; in 1901, 860,000.

GLAMORGAN TREATY. A compact made with the Irish Roman Catholics by the Earl of Glamorgan on August 25, 1645. By it Charles I. was to receive military aid and Roman Catholicism was promised a more formal recognition by the Government.

GLANCE (Eng. equivalent of Ger. *Glanz*, glitter, used in the same sense). A name formerly applied to minerals which have a lustre similar to that of metals. The following are some of the more important of these minerals: *antimony glance*, which is the mineral *stibnite*, or antimony trisulphide; *bismuth glance*, which is *bismuthinite*, or bismuth trisulphide; *copper glance*, which is *chalcocite*, or cuprous sulphide; *glance blende*, which is *alabandite*, or manganese sulphide; *glance coal*, which is *anthracite*, or hard coal; *glance cobalt*, which is applied both to *cobaltite*, or cobalt sulpharsenide, and to *smaltite*, or cobalt diarsenide; *gold glance*, which is *sylvanite*, or gold and silver telluride; *lead glance*, which is

galena, or lead sulphide; and *silver glance*, which is *argentite*, or silver sulphide. The name *glance wood* has been applied to an exceedingly hard variety of wood that is found in the tropics, and is used for making tools.

GLANCE COAL. A popular term for any hard lustrous variety of coal, but usually applying to anthracite.

GLAND (Lat. *glans*, acorn). A term applied to a secreting organ. Glands are divided by anatomists into two great classes, viz. true secreting glands and ductless glands. The first class constitute special organs which are destined for the production of the chief secretions; as, for example, the lachrymal, mammary, and salivary glands, the liver, pancreas, kidneys, etc.; while the suprarenal capsules, the spleen, the thymus, and the thyroid belong to the second class.

SECRETING GLANDS. An ordinary secreting gland consists of an aggregation of follicles (small tubes or sacs), all of which open into a common duct, by which the glandular product is discharged. The follicles are lined with epithelial cells, placed upon a hyaline basement membrane, which in turn is surrounded by a network of capillaries. These furnish the blood from which is elaborated the secretion by the cell-substance or protoplasm of the epithelia, according to one theory. Some assert that the secretion is composed of transformed cell-substance. The secretion of a gland is either mucous (like saliva), serous (like tears), sebaceous (like the oil of the skin), or albuminous. The secretions of the testicle and ovary are notable for containing living cells, the spermatozooids and the ova, respectively. The simplest form of a gland is the inversion of the surface of a secreting membrane into follicles, which discharge their contents upon it by separate mouths. Of this we have examples in the gastric glands and follicles of Lieberkühn, described under DIGESTION, ORGANS OF. Secreting glands are divided into: (1) *Tubular*, consisting of cylindrical tubes, single or branching; and (2) *saccular*, composed of numerous sacs arranged about a short tube which joins other similar tubes. The sacs are called *acini*, and such glands are also called *racemose* (Lat. *racemus*, a bunch of grapes). To understand the structure of a complex gland like the liver or kidney, it must be followed from the simplest form in which it is known to occur through its various degrees of evolution. In this way the liver may be traced, from the lowest mollusca (where it exists as simple follicles, lodged in the walls of the stomach, and pouring their product into its cavity by separate orifices) up to man, in whom it is an organ of extreme intricacy; and similarly in the early fetal state of the higher animals, the liver and other secreting organs more or less resemble the persistent state of those parts in animals lower in the scale. In the same way the mammary gland, which is a structure of considerable complexity in the higher animals, presents a very simple arrangement in the lowest type of this class, the ornithorhynchus, being merely a cluster of cæcal follicles, each of which discharges its contents by its own orifice. Sometimes a gland has several ducts (as, for example, the lachrymal gland), but as a general rule the most important glands have only a single canal, formed by the union of the individual ducts, which conveys the product of the secreting action of the whole mass.

DUCTLESS GLANDS. Glands of the second class resemble those of the first class in external conformation, and in the possession of a solid parenchymatous tissue, but differ from them in the absence of a duct or opening for the removal of the products of secretion; and indeed, except in the case of the thymus, no material resembling a secreted product is yielded by any of them. In all of them, the tissue mainly consists of cells and nuclei, with a great abundance of blood-vessels. They furnish necessary material to the body, in some yet unascertained way. If they are removed by operation, or absent from birth, or atrophied during life, the result is a condition of disease. For example, removal or atrophy of the thyroid is followed by myxædema, a disease which is relieved by feeding thyroid gland to the patient.

The so-called *lymphatic glands* belong to a different class of structures, and will be described in the article under LYMPHATICS. They are not glands, but nutritive organs. See BARTHOLIN'S GLANDS; BRUNNER'S GLANDS; COWPER'S GLANDS; LIVER; PANCREAS; KIDNEY; THYROID GLAND; etc. Consult: Gray, *Anatomy, Descriptive and Surgical* (London, 1901); Morris, *Human Anatomy* (Philadelphia, 1902); Heitzmann, *Atlas der descriptiven Anatomie des Menschen* (Vienna and Leipzig, 1902); Freeborn, *Notes on Normal Histology* (New York, 1901); Stoehr, *Text-book of Histology, including the Microscopical Technique* (Philadelphia, 1901).

GLAND. In plants, a single cell or group of cells especially adapted to form and excrete some substances. Glandular cells are usually distinguished from others by the granular character of their protoplasm, especially when in the active state. Glands may be superficial or internal. *Superficial glands* may consist of a few cells or even a single cell, in which case they are often raised upon stalks and constitute the so-called glandular hairs, as upon the leaves of geraniums and primroses; they may have the form of disks upon short stalks, in which case the structure is known as a glandular scale; they may be groups of epidermal cells covering cushions of tissue, as in the so-called nectary (q.v.) in many flowers; they may be flush with the surface, pouring their secretion into gland-lined pits or depressions which may be narrow and deep or even branched canals, as in the nectar glands of some lily flowers. *Internal glands* in their simplest form consist of cells in which the secretion is formed and retained until released by the rupture or crushing of the tissues, as in the gland-cells of capers. Not uncommonly the gland-cells are destroyed by the plant itself, in which case the freed secretion occupies their place, as in the oil-glands of the orange and lemon rind; in other cases they line an internal spherical or tubular reservoir, into which the secretion is poured—as in the resin-tubes of pines (see figure).

Regarding the process of secretion nothing is definitely known. The secretion in most cases is formed by the protoplasm and within the cell-wall; in others it may be developed at the surface, the materials for it being secreted by the protoplasm. In superficial glands the secretion is sometimes pushed through the cell-wall as far as the cuticle, which it cannot penetrate, but which it lifts into a blister; e.g. the volatile oils secreted by many leaves.

Glands are named for the most prominent material which they secrete, as water, lime, nectar, oil, and resin glands.

GLAND OF ORANGE-RIND.

The gland-cells form a globular mass, secrete an essential oil, and finally become disorganized, leaving the oil free in the space they formerly occupied. The contents of the cells are not shown.

GLAND, COMPARATIVE ANATOMY OF. Neither a definition nor a classification of glands has yet been agreed on by comparative anatomists. Since the word itself offers no clew to its real meaning, we must attempt to define it from universally accepted examples. Among these may be mentioned salivary glands, lachrymal glands, sweat-glands, and poison-glands. All of these are organs which produce some particular substance from the blood with which they are supplied; furthermore, this substance is not cellular nor living, but is a mere chemical product. These facts give us a clew to our definition, and we may say that a gland is any cell or group of cells whose function is the production of a chemical substance, usually fluid, peculiar to itself. Such a definition will not include all those organs to which the name gland is given, but it will include all to which it ought to be applied. As an example of the incorrect use of the term, we may refer to 'reproductive' or 'genital' gland, as applied to the testis or ovary. These organs are not in any true sense glands, for they do not produce any chemical substance peculiar to themselves, but are simply the portions of the body where those cells are formed from which the next generation arises. So also the use of 'gland' in connection with the suprarenal capsule, the pituitary body, and the pineal body is incorrect and confusing.

Various classifications for glands have been proposed based on their structure, whether unicellular or multicellular, simple or branched, etc.; but it is perhaps as natural and certainly as convenient to arrange them according to their function. Thus we may class those which open on the surface of the body and are developed in the skin as tegumentary glands; those connected with the process of digestion as digestive glands; those connected with the blood system as vascular glands; those associated with the respiration as respiratory glands; and those connected with the reproductive organs as reproductive glands. The tegumentary glands may well be grouped according to their structure, as unicellular and multicellular glands, and the same classification is often applied to all glands.

Unicellular glands are everywhere abundant in invertebrates, but in vertebrates they are confined almost entirely to the lower forms. Multi-

cellular glands are to be regarded as aggregations of unicellular glands in one region. Soon the multicellular gland differentiates into a secretory and an efferent part, or duct. Multicellular glands with ducts are tubular or acinous. Globular glands also occur in the epidermis of Amphibia. The tubular glands may be simple, branched, or anastomosing. Tubular glands first occur in the Amphibia in a few cases, but they are very abundant as sweat-glands in mammals. Acinous glands first appear in birds as uropygial glands, where they occur on the rudimentary tail and produce the oil for oiling the feathers. Among mammals acinous glands are highly developed and are of two kinds: namely, sebaceous glands and milk-glands. The sebaceous glands open on the rim of the eyelid, and on other special parts of the body, in intimate relation with hairs. In addition to oiling the hair, these glands probably have a sexual function in mammals, since their secretion has a decided odor.

Milk-glands, characteristic of the mammalia, have probably a common ancestry with sebaceous glands, or they may even consist, indeed, of a group of highly specialized sebaceous glands. The glands of *Echidna* occur in the mammary pocket. Into this pocket the immature-hatched young are placed, and there they are nourished by a secreted substance which is not like the milk of other mammals. The glands are in connection with hair-follicles. Among marsupials there is a larger number of mammary pockets; but these pockets have lost their protective function, which latter function is assumed by the marsupium. In *Ornithodelphia* the nutritive function is subserved by the secretions of sweat-glands. The region of the integument, at which the glands open, is usually modified for the purpose of transmitting to the young the secretion of the glands. There are three types of these openings. The athelous type is found only in the lowest mammals; here the glands open diffusely on the surface without a true nipple. In the second type the glands open at the base of an elevated crater, and in the third the region of their opening is elevated to the apex of a cone. To the second type belong the glands of the carnivores and ungulates, and to the third class belong those of marsupials and primates. The number of these glands varies in different kinds of animals and with the number of young produced in a litter. In man two is the normal number, but in a number of cases supernumerary nipples have been recorded both for males and females. Such cases are atavistic and point back to the condition which existed in man's ancestor.

The liver and pancreas are recognized as the largest of the digestive glands, to which group also belong the salivary glands, gastric glands, and intestinal glands. The poison-glands of snakes, as modified salivary glands, also belong here. Of vascular glands the kidneys are decidedly the most important, while respiratory glands include the arytenoid and tracheal. Of reproductive glands we find a great variety among both invertebrates and vertebrates, such as the yolk and shell glands, and in mammals the Cowper's and prostate glands.

Any attempt to classify glands according to the substances they produce is unsatisfactory. Thus, if we attempt to separate secreting from excreting glands, we find that while the kidneys clearly belong in the latter class, the liver belongs to

both, though chiefly secretory, and sebaceous glands are also difficult to classify. Perhaps the most obscure organs of this class are the so-called 'ductless' glands, the spleen, thyroid, and thymus. They seem to produce some substance of great importance to the well-being of the body; but what it is, and how it affects the organism, are still involved in difficulties. However, as they are all closely associated with the blood system, they may well be called vascular glands.

GLANDERS (from *gland*, from Lat. *glans*, acorn). A virulent contagious disease due to the action of a specific microbe, the *Bacillus mallei*. The microbe was discovered in 1882 by Loeffler and Schütz. It is a short, rather stubby rod, with rounded ends. It stains irregularly, occurs singly, in pairs, or in long strings, and grows readily in the ordinary culture media. As a result of natural contagion, glanders is almost entirely confined to the horse, ass, and mule. Cattle enjoy an immunity from it, and sheep and pigs are highly resistant to natural contagion. Dogs, cats, and wild carnivora may become infected by eating the meat of glanderous horses. Glanders has been known since the time of the classic Latin and Greek writers as one of the most dreaded horse diseases. Its distribution is practically universal, though it is said not to occur in Australia.

Glanders appears under several forms with different symptoms. The acute and chronic forms of glanders are universally recognized. The acute form begins with a high fever. The coat is staring and there are frequent chills. The mucous surfaces are reddened or sometimes yellowish, purulent ulcers appearing on those of the nose. These ulcers rapidly increase in size and depth. Painful swellings occur on various parts of the body, especially in the neighborhood of the lymphatics. In many cases the joints of the legs are affected by acute inflammation. Death generally occurs in from eight to thirty days. Chronic glanders occurs in the skin-form known as farcy, and as true glanders affecting the lungs and other internal organs. In farcy the symptoms begin by the formation of nodules under the skin, known as farcy buttons. The surrounding tissues are broken down, and running ulcers are thus formed. After a variable period these ulcers heal. The disease breaks out again, however, in the same or other locations. The farcy buttons occur most frequently on the neck, shoulders, and inside the thighs.

During the progress of ordinary chronic glanders the lungs are affected by glanderous pneumonia. A lobular V-shaped pneumonia, occurring at the various foci of infection, is characteristic of glanders. Tubercles of sizes varying from that of a millet-seed to that of an egg are formed in the lungs, liver, spleen, and occasionally in the kidneys. The tissue of these tubercles breaks down, leaving cavities filled with pus, some of which, in long-standing cases, may ultimately heal.

The symptoms of chronic glanders which are most relied upon by practicing veterinarians for diagnostic purposes are nodular swelling of the submaxillary glands, a dry cough after exercise, farcy buttons on the skin, and a persistent purulent discharge from the nose.

The spread of the disease is due chiefly to the discharges from the nose and from farcy sores. The virus from these sources may contaminate harness, vehicles, fences, stables, water-supply,

etc., through which other animals are readily infected.

Nearly all the tonics and curative agents known to veterinary medicine have been used in the treatment of glanders, but without result. Medical treatment is of no avail. Spontaneous recovery takes place in rare instances. When the chief symptoms are those of farcy, apparent recovery takes place at intervals, followed by renewed outbreaks of the disease. The nasal symptoms may also cease, and later recur. In chronic cases the disease may persist for several years before death occurs.

Glandered animals should be shot and buried or burned. Such procedure is required by law in nearly all countries. Stables and all articles with which glandered horses have come in contact should be disinfected.

For the detection of cases of glanders the symptoms already mentioned are not always sufficient. In latent cases recourse is had to injections of mallein. This substance is prepared from the glanders bacillus and contains the glanders toxin, but not the living bacilli. An injection of this substance into healthy horses causes no reaction. In glanderous horses it produces an elevation of temperature, swelling of the submaxillary glands, and trembling, which subsides after a few hours. A rise in body temperature of 2°F. after a mallein injection is considered good evidence of the presence of glanders. Some investigators have obtained quite striking curative effects from the continued use of large doses of mallein. Injections of the colloidal silver preparation also cause an elevation of temperature in glanderous subjects, and are used to some extent as a diagnostic agent for glanders.

GLANDERS IN MAN, otherwise called **EQUINIA**. Man may acquire the disease by accidental inoculation from the horse, though several cases have been recorded in which glanders has been transmitted from one human being to another. The symptoms of acute glanders in man are: Weakness, chills, muscular and articular pains, the appearance of nodules with swelling and redness, rise of temperature, and suppuration. A single ulcer may cause great swelling of the whole hand and arm, with œdema, enlarged glands in armpits, and subsequent ulcers and pustules upon the swollen surface. A discharge from the nasal cavities appears, watery and viscid at first, afterwards purulent and very offensive. The nose becomes swollen and painful, and perforations of the cartilage occur. The mouth becomes dry, dark red, and thickly coated; constipation is followed by diarrhœa; intense nervousness or delirium may follow; albumin appears in the urine. Emaciation and prostration are followed by death in the fourth week, in fatal cases. Besides the acute form just described, there is also a chronic form of glanders in man, but this occurs very rarely. Consult: Bass, "Die Rotzkrankheit der Pferde," in *Deutsche Zeitschrift für Thiermedizin* (Leipzig, 1893); Nocard and Leclainche, *Les maladies microbiennes des animaux* (Paris, 1898); Grange, "Glanders and Farcy," in *Michigan Experiment Station Bulletin No. 78* (Agricultural College, Mich., 1891); Williams, "Glanders," in *Montana Experiment Station Bulletin No. 4* (Bozeman, Mont., 1894).

GLANDINA (Neo-Lat., from Lat. *glans*, acorn). A genus of large pulmonate mollusks, or land-shells, of the shell-bearing slug

family Testacellidæ. It includes about 125 species, whose shells are somewhat fusiform in shape, smooth, polished, and beautifully colored and marked. They creep about among the herbage and on bushes, and are voracious feeders upon other smaller snails and all sorts of animal matter. Most of them belong to the American tropics, but one, at least, is European. Several species enter the southern border of the United States, of which the best known is the rose-tinted extremely variable *Glandina truncata*, which is illustrated on the Colored Plate of NORTH AMERICAN SNAILS.

GLANDS, DISEASES OF THE. The lymphatic glands are subject to enlargement from acute inflammation and abscess, usually in consequence of irritation of the part from which their lymphatics spring, as in the case of scarlet fever and diphtheria (qq.v.), in which the glands of the throat are affected; or in the case of gonorrhœa (q.v.), in which the glands of the groins are affected; in bubonic plague, in which the glands of the groins, armpits, or neck, etc., may be affected. The treatment of such abscesses is within the scope of ordinary surgery. A much more troublesome affection of the glands is the slow, comparatively painless, at first dense, solid swelling which they undergo in scrofula (q.v.), which tends very slowly, if at all, to suppuration, and sometimes remains for years. In syphilis (q.v.) and cancer there are also enlargements of the lymphatic glands. Scrofulous or tubercular diseases of the mesenteric glands in children constitute *tubercles mesenterica*. (See MESENTERY.) The larger glands, as the liver, kidney, pancreas, spleen, thyroid, thymus, testicle, and even the pituitary gland, have all their special diseases, which are noticed under the names of these organs.

GLANEUSES, gl'ânēz', LES (Fr., The Gleaners). A celebrated painting by François Millet (1857), representing a field in which three women are picking up the forgotten stalks, while the laborers are seen with loaded wagons in the background. The picture is remarkable for its effects of light, and is considered one of Millet's best works.

GLANVILL. The putative author of the first classical text-book of the English common law. This work, *A Treatise on the Laws and Customs of England* (*Tractatus de Legibus et Consuetudinibus Angliæ*), appears from internal evidence to have been composed toward the close of the twelfth century, and in the last years of the reign of Henry II. The Glanvill whose name it bears is doubtless the celebrated Ranulph de Glanvill, Chief Justiciar and Prime Minister of Henry, one of the conspicuous figures of that stormy period of English history. He came of a Suffolk family of position, was Sheriff of Yorkshire from 1163 to 1170, and in 1174, when Sheriff of Lancashire, led the forces of the King against the invading Scots, and won a great victory. Thereafter his place was at the right hand of the King as trusted adviser, ambassador, prime minister, and justiciar. He died at Acre in 1200, to which place he had gone with Richard I. on his crusade to the Holy Land.

But there is no trustworthy evidence that Ranulph de Glanvill wrote the law book attributed to him. It is more likely to have been the work of some learned clerk at his court, perhaps of his

secretary and kinsman, Hubert Walter, and that the title of the work is a dedication rather than an attribution. But there can be no doubt that it represents the law of Glanvill's time, and is a correct picture of the legal system which he was engaged in shaping. Though the writer must have had some knowledge of the canon law, his work is English both in matter and arrangement. That is to say, it is not 'institutional' and scientific in form, but empirical and practical. It sets forth the procedure of the King's Court, the *Curia Regis*, the various pleas which it will entertain, the several classes of wrongs which it will remedy, and the plea appropriate to each, and so considers the substantive law, both civil and criminal, after the usual common-law method, from the standpoint of procedure. It immediately took high rank as a legal authority, and retained its unquestioned supremacy until superseded, sixty or seventy years later, by Bracton's great work. In the meantime many editions, as we should call them, by various annotators, appeared, and many of these manuscripts are still in existence. A Scotch version, known as the *Regiam Majestatem*, long passed as an original treatise.

Glanvill was first printed in the year 1554 at the instance of Sir W. Stanford, a judge of the Court of Common Pleas. It was early translated into French and an English version by Beames appeared in 1812. A new edition of Beames's translation has recently appeared under the careful editorship of Prof. Joseph H. Beale, Jr. (Washington, 1900).

GLANVILL, JOSEPH (1636-80). An English divine, born at Plymouth. He graduated at Exeter College, Oxford, in 1655, took the degree of M.A. at Lincoln College in 1658, and became chaplain to Francis Rous, provost of Eton. After the Restoration he conformed, and in 1660 became rector of a little church at Wimbish, Essex, by appointment of his brother, a prominent London merchant. He became interested in the teachings of Henry More and the Cambridge Platonists, and was one of the early fellows of the Royal Society. At Wimbish he wrote his first and best known work, *The Vanity of Dogmatizing* (1661), an attack on the scholasticism of the Oxford School. It is chiefly interesting because it anticipates Hume's theory of causation, and because of a curious anticipation of the electric telegraph, in which he says: "To enter at the distance of the Indies by sympathetick contrivances may be as natural to future times as to us is a literary correspondence." It also contains the story of the 'Scholar Gypsy' from which Matthew Arnold obtained the basis for his notable poem. He was appointed rector of the Abbey Church at Bath in 1666, and chaplain in ordinary to Charles II. in 1672. During the 'Popish Plot' excitement he wrote a spirited attack on the non-conformist sects, *The Zealous and Impartial Protestant* (published after his death in 1681). Among his voluminous works, written in a rather rhetorical style, besides those mentioned are: *Lux Orientalis* (1662), a defense of More's doctrine of the pre-existence of souls; *Scæpsis Scientifica* (1665; reprinted 1885), a revision of his first work with additions; *Philosophical Considerations, Touching Witches and Witchcraft* (1666); *Plus Ultra, or the Progress and Advancement of Knowledge Since the Days of Aristotle* (1668); *The Ways of Happiness* (1670); *An Earnest Invitation to the Lord's*

Supper (1673); *Essays on Several Important Subjects* (1676), containing his remarkable "Anti-Fanatical Religion and Free Philosophy," in continuation of Bacon's *New Atlantis: An Essay Concerning Preaching* (1678).

GLANVILLE, BARTHOLOMEW DE. See BARTHOLOMÆUS ANGLICUS.

GLAPTHORNE, HENRY. An English dramatist of whose life nothing is known except that he was a friend of Cotton and Lovelace, and wrote most between the years 1639 and 1643. His works consist of: *Albertus Wallenstein*; *Argalus and Parthenia* (1639), a dramatization in verse of a part of the *Arcadia*; *The Hollander* (1640); *Wit in a Constable* (1640); and *The Ladies' Privilege* (1640). Other plays have been credited to him, but the authorship is most uncertain. He wrote a volume of *Poems* (1639); and a poem called *Whitehall* (1643). His works may be characterized as indifferent and feeble.

GLAREANUS, glä'ra-nōs, HENRICUS (1488-1563). A Swiss humanist and musical theorist, whose name was Heinrich Loriti. He was born at Mollis, Canton of Glarus (whence his name). He studied music under Cochläus at Cologne, where he also gave considerable attention to philosophy and theology. At the age of twenty-four he became poet laureate to Emperor Maximilian I. He taught mathematics at Basel from 1515 to 1517, when his friend Erasmus is said to have secured for him an appointment to the chair of philosophy at Paris. At first a defender of Reuchlin, and a follower of the Reformation, he is believed subsequently to have changed his views, and to have removed to Basel, accepting a professorship at the university in that city about 1529, whence he afterwards removed to Freiburg. Biographical details concerning him are somewhat meagre and unreliable; more is known of his work. One of his principal publications is entitled *Isagoge in Musicen Henrici Glareani*, etc. (1516), the first work published by him, and treating of solmization, the intervals, tones, and modes. His *Dodekachordon* (1547) is still of great value to the historian and student of music, inasmuch as here, for the first time, the theory is enunciated that there should be twelve, instead of eight, church modes, corresponding to those of ancient Greece. The work is divided into three parts and is furnished with numerous examples from the works of Ockenheim, Josquin de Près, and other famous composers of the fifteenth and sixteenth centuries.

GLARUS, glä'rōs. A canton of Switzerland, bounded by the Canton of Saint Gall on the north and east, Grisons on the south, and Uri and Schwyz on the west (Map: Switzerland, D 1). Area, 267 square miles. The centre is taken up by a valley open on the north and inclosed on the east, south, and west by snow-capped mountains, most of them exceeding 10,000 feet in altitude. The chief river is the Linth, flowing into the Wallensee. Agriculture is of secondary importance, domestic products not sufficing to meet the home demand. The chief manufactured products are cotton, woolen, and silk goods, and beer. The canton is well provided with transportation facilities, and carries on a considerable trade in textiles.

The form of government is thoroughly demo-

cratic. The people exercise their legislative power directly, assembling for that purpose once a year in the Landsgemeinde. The executive power is vested in a council of seven members elected by the Landsgemeinde for three years. The rural communities are administered by communal councils. The population of Glarus was 33,825 in 1888, and 32,349 in 1900. The inhabitants are mostly Protestant and speak German. Capital, Glarus (q.v.).

GLARUS. The capital of the Swiss canton of the same name, situated on the Linth, 43 miles by rail from Zurich (Map: Switzerland, D 1). The chief buildings are the Gothic church, used by Roman Catholics and Protestants, and the Government buildings, containing a natural museum and an art collection. The town is lighted by gas and electricity, and has water-works. There are cotton-printing mills, bleacheries, cigar-factories, and breweries. The commerce is of considerable importance. Population, including the suburbs, in 1900, 4877, mostly Protestants.

GLAS, JOHN (1695-1773). Founder of the Glassites or Sandemanians. He was born at Auchtermuchty, Fifeshire, Scotland, September 21, 1695. He studied at Saint Andrews and Edinburgh, entered the ministry, and became a popular preacher. In his *Testimony of the King of Martyrs* (1727) he maintained that all national establishments of religion and all interference of the civil authority in religious affairs are inconsistent with the true nature of the Church of Christ, and was thus probably the first to assert the voluntary principle in Scotland. For advocating such views he was first suspended, and later deposed from the ministry (1730). He then formed an independent congregation in Dundee, and in 1733 removed to Perth, where he built his first church. He was here joined by Robert Sandeman, who married his daughter, and became the better-known leader of his followers in England and America. He died at Perth, November 2, 1773. Notwithstanding some intellectual eccentricities, Glas was a man of strong character and sound scholarship. His works were published at Dundee in 1782-83. The thirteenth edition of his *Christian Songs* appeared at Perth in 1847. See SANDEMAN, ROBERT; SANDEMANIANS.

GLASER, glä'zër, ADOLF (1829-). A German author, born at Wiesbaden. For more than twenty-two years (1856-78) he continuously conducted *Westermann's Illustrierte Monatshefte* and he again became associated with that publication in 1882. His first success was the novel *Schlitzwang* (2d ed. 1819), which was followed by a long series of historical novels, such as *Wulphilde* (1880) and *Savonarola* (1883). His principal dramas are also chiefly historic; they include *Galileo Galilei* (1861) and *Johanna von Flandern*. He is favorably known as a translator from the Dutch. His collected works were published in twelve volumes in 1891.

GLASER, EDUARD (1855-). An Austrian explorer, born at Deutsch-Rust, Bohemia. He studied physics, geology, and astronomy at Vienna and Prague, and afterwards devoted himself to the study of Oriental languages, visiting Egypt and Tunis for that purpose. In 1882 he observed a total eclipse of the sun at Sohag, Upper Egypt, and subsequently made a trip to

Southern Arabia. In 1885 and thereafter he again made several tours through Arabia, and collected nearly 2000 manuscripts and numerous archaeological specimens. Many of these acquisitions, which are relics chiefly of the city of Mārib, the capital of the ancient Sabæan kingdom, are in the Imperial Library, Vienna. Glaser's researches on the topography of Arabia, and on the various dialects of the southern portion of the peninsula, are also highly important. Besides numerous contributions to scientific periodicals, his publications include the works entitled: *Mitteilungen über einige aus meiner Sammlung stammende sabäische Inschriften* (1886); *Skizze der Geschichte und Geographie Arabiens von den ältesten Zeiten bis zum Propheten Muhammad* (1889 et seq.); and *Die Abessinier in Arabien und Afrika* (1895).

GLÄSER, glä'zër, FRANZ (1798-1861). An Austrian composer. He was born at Obergeorgenthal, Bohemia, and after singing for some time in the choir of the Court chapel at Dresden, he entered the conservatory of Prague. He was conductor at the Josephstädter Theatre, Vienna, from 1817 until 1830, when he was called in the same capacity to the Königstädtisches Theatre, Berlin, where his best opera, *Des Adlers Horst*, was produced in 1832. This opera was subsequently extensively performed throughout Germany, and until about 1870 enjoyed considerable popularity. In 1842 Gläser was appointed royal orchestra leader at Copenhagen, where he remained until his death. Among the thirteen operas composed by him, the above-mentioned production and *Die Hochzeit am Comersee* were the most successful.

GLASER, glä'zër, JULIUS ANTON (originally **JOSUA**) (1831-85). An Austrian jurist and statesman. He was born at Postelberg, Bohemia, of Jewish extraction, and was educated at Vienna and Zurich. In 1856 he was appointed professor in the University of Vienna. In 1871 he was elected to the Diet of Lower Austria, and from 1873 to 1879 he was a member of the Austrian Reichsrat. During the period of 1871-79 he was Minister of Justice in the Auersperg Cabinet, and subsequently was procurator-general at the Court of Cassation, Vienna. He was one of the foremost jurists of his day, and aided greatly in the reformation of criminal jurisprudence in Austria. His principal publications are: *Die Fragstellung im Schururgerichtsverfahren* (1863); *Zur Juryfrage* (1864; republished with the preceding work in 1879, under the title *Schururgerichtliche Erörterungen*); *Anklage, Wahrspruch und Rechtsmittel im englischen Schururgerichtsverfahren* (1866); *Gesammelte kleinere Schriften über Strafrecht, Civil- und Strafprozess* (2d ed. 1883); *Sammlung strafrechtlicher Entscheidungen des k. k. Obersten Gerichtshofs* (3 vols., 1872).

GLASGOW, gläs'kò. The industrial metropolis and the largest city of Scotland; after London, the largest city in the United Kingdom (Map: Scotland, D 4). It is situated on the Clyde, in the lower ward of Lanarkshire, and occupies chiefly the north side of the river, but has large and populous suburbs on the south side. The river is crossed by several bridges. Two of granite and one of iron are much admired for their light and graceful architecture. Two

are suspension bridges, and two are the viaducts of the Union and the Caledonian railways. Below the bridges, ferry-boats ply at all hours.

Glasgow is built for the most part on level ground, but in the north and northwest districts there are considerable elevations. Owing to the great number of factories and mills of all kinds, the city has a somewhat dingy and smoky aspect; in other respects it has many attractions. The houses facing the river stand well back, leaving spacious thoroughfares on each side which afford full and noble views of the bridges, of several handsome street ranges and public buildings, and of the harbor with its funnels and forests of masts. Most of the leading streets run from east to west, parallel with the river, and almost all the streets, except in the oldest parts of the city, are laid in straight lines. The houses are generally lofty, and built of freestone, the floors of each tenement being usually occupied by separate families, entering by a common stair. In the fashionable quarters elegant residences prevail. The city may be divided into the eastern and western sections, separated by Buchanan Street, the former containing all that there is of antiquarian interest, and many of the modern public buildings; the latter, the more modern and fashionable quarter. The principal business streets are Argyll, running parallel to the river; Buchanan, running at right angles; and Sauchiehall, the main thoroughfare to the west end residential section. George Square, the centre of the city, is adorned with a lofty column surmounted by a statue of Sir Walter Scott, equestrian statues of Queen Victoria and the Prince Consort, and statues of Sir John Moore, James Watt, Sir Robert Peel, William Pitt, and others. About this square are clustered some of the most notable buildings in the city, such as the municipal buildings, Merchants' House, Bank of Scotland, and the General Post Office. Among other public buildings are the Royal Exchange in Queen Street, in the Corinthian style, in front of which stands a colossal equestrian statue of the Duke of Wellington; the magnificent new buildings of the university, erected at a cost of over \$2,000,000; the corporation galleries, containing an extensive picture collection; and the Institute of Fine Arts, devoted to periodical exhibitions of modern works of art. The buildings of antiquity are situated in the Irongate and High Street. The cathedral, begun in 1238 and completed about the middle of the fifteenth century, was designed in the form of a cross, but the transepts were never completed. It is Early English in style, and is particularly noted for its beautifully proportioned and elaborately decorated crypt. In the Necropolis above the cathedral are numerous tasteful monuments, the most conspicuous being the column erected in memory of John Knox. It is the burial-place of the dramatist Sheridan Knowles.

Glasgow owes its industrial and commercial importance to its advantageous situation in the midst of a district abounding in coal and iron. Much of its prosperity is due also to its position at the mouth of the Clyde River and the possession of a splendid harbor. Over \$100,000,000 has been expended in the widening and deepening of the river, which is now navigable by vessels drawing 23 feet of water. The merchant marine of Glasgow in 1891 comprised

1576 vessels, of which 1013 were steamships, with a total capacity of 1,309,816 tons; in 1900 there were 1668 vessels (1172 steamers), with a tonnage of 1,630,170. More than 11,000 ships, with over 7,000,000 tons of merchandise, entered and cleared during that year. The total value of imports during that year exceeded \$70,000,000, the average annual value during five years preceding having been \$63,000,000; value of exports over \$92,000,000, showing an increase from 1896 to 1900 of over \$4,600,000. The chief articles of export are woolen, cotton, and linen goods, machinery, mill-work and metal manufactures, coal, paper, chemicals, and spirituous liquors. The imports include largely raw products, such as wheat, corn, flour, sugar, wool, metal ores, timber, tobacco, and petroleum. Among Glasgow's industries, ship-building is one of the most conspicuous, the city being the chief centre of that industry in the world; the building of all kinds of machinery is next in importance, followed by cotton spinning and weaving, the latter industry employing some 20,000 people. Calico-printing, dyeing, and beer-brewing should be mentioned, as well as the famous Saint Rollox Chemical Works, one of the largest of its kind in the world, having a chimney-stack 460 feet high, a conspicuous landmark of the city.

The government of the city is administered by a lord provost, ten bailies, and forty-eight councilors, to whom are added the dean of guild from the Merchants', and the deacon-convenor from the Trades' House. See paragraph on *Local Government* under GREAT BRITAIN.

Glasgow has led in the work of municipal reform in Great Britain. Its various improvements and great undertakings have been carried out by the Municipal Council, which, under an act of Parliament, constituted itself in each case as a 'trust,' such as the Improvement Trust, the Police Trust, the Market Trust, the Navigation Trust, etc. For purposes of practical work, the various trusts, i.e. the council in its several capacities, elect sub-committees, which have immediate supervision of the respective departments of city administration. Thus the Sanitary Department, or Board of Health, is under the supervision of a council committee of eighteen, with sub-committees on cleansing and hospitals. It is administered by a chief inspector, assisted by some hundred and fifty inspectors, the work of each being highly specialized. The thorough organization of the Board of Health and the numerous other improvements of the city were necessitated by the extreme density of the population, and the consequent high rate of mortality among the working people. In 1865, the year marking the beginnings of the various public undertakings, the average density was nearly 600 to the acre, exceeding 1000 in certain districts. The average mortality in 1864 was 32.8 per thousand, and as high as 38.64 for a series of preceding years. The great work of the Improvement Trust in cutting wide streets as well as in laying out new ones, in demolishing old buildings and creating vacant space, and in a good many other ways helping to disperse the population over a wider area, resulted in reducing the average density to 92 in 1891. Still, at the present day, a vast number of families occupy single-room dwellings. The death-rate has been steadily falling, as seen from the following figures: In 1864 it

was 32.8; in 1872, 28.7; in 1886, 24.3; in 1896, 20.4; in 1898, 21.2.

In addition to its work of prevention of disease, the Sanitary Department pays due attention to combating prevailing disease. Its two great municipal hospitals are not only models in appointment, but are built in a very attractive manner. Special buildings are provided for infectious diseases. The sanitary wash-houses are used for disinfecting the belongings of families whose members are afflicted with contagious diseases, the families themselves being entertained at the cost of the city in its 'house of reception' while their homes go through the process of disinfection and whitewashing. The Cleansing Department probably contributes as much to the health of Glasgow as its Sanitary Department. In addition to the usual sweeping and sprinkling of public streets, this department attends to the cleansing of private court-yards and passageways, the owners being assessed a slight tax to cover the expense. The street-sweeping is done by machines at night. The litter swept up by men and boys during the day is deposited in covered iron bins, located under the surface of the streets at short intervals. There are three principal 'dispatch stations,' together with a number of minor ones, at which the city garbage undergoes a treatment which converts the greater part of it into manure. The city owns a number of farms for the utilization of that part of the refuse which cannot be marketed. To avoid contamination of the waters of the Clyde, the city's sewage is treated chemically in a special sewage plant, where it is made to precipitate all its solid ingredients, which are then made into 'cakes' by powerful presses, and passed automatically into freight-cars standing on the tracks below. Most of the cakes are utilized at the city's farm for raising fodder for the horses employed in the Cleansing and Street Railway departments. The water remaining after the precipitation of the solid ingredients is filtered, and passed entirely pure into the Clyde. All of these improvements, though originally involving a considerable outlay of capital, have more than paid for themselves.

The Glasgow police consists mostly of Highlanders, nearly 1400 in number, who are universally praised for their intelligence and efficiency. The police courts constitute a part of the police department. Justice is administered by the Lord Provost and the bailies. Half of the expense of the department is met by the General Government, the net cost of the police service to the city being only \$250,000.

The city possesses considerable and profitable real estate. There are, at present, some two dozen municipal tenements, which, though superior to the private houses of the same class, are built largely in undesirable localities, and thus utilize land which could not be disposed of otherwise. The city owns also a great number of old, insanitary tenements.

The seven municipal lodging-houses, six for men and one for women, are models in their line, and a boon to the poor. Although the charge is only seven to nine cents per night, they yield a revenue above all expenses, including interest. In 1896 the municipal family home was opened to accommodate families of widows or widowers

who are obliged to part with their children during the day. It contains all the necessary accommodations, including playrooms, playgrounds, and a nursery. There are nurses to take care of the children while their parents are at work. The charges are: For mother with one child, 76 cents per week; mother with two children, 92 cents. Board: Breakfast, five cents; dinner, eight cents; tea, six cents. The public baths comprise five large establishments containing swimming-pools, and accommodating on the average 1500 people per day. The public wash-houses are fitted out with steam boiling apparatus, centrifugal machine driers, hot-air apartments, steam-operated roller-mangles, etc. The charge for their use is four cents per hour.

The public lighting is done by the city. After having taken over the gas plant, the city went on improving it, at the same time reducing the cost of gas to consumers. In the twenty odd years from 1869 to 1891 the population increased from 25 to 30 per cent., and the consumption of gas increased 170 per cent. From \$1.14 per 1000 feet in 1869, the price has gradually been reduced to 60 cents, without diminishing the net profits. In 1893 the city opened a large electric plant which has proved a great success, and lights not only the streets and public buildings, but also all private courts and stairways.

The water-supply is under the management of the City Council, known for that purpose as the Board of Water Commissioners. In 1860 a new supply of water was introduced from Loch Katrine by means of a large reservoir covering an area of 86¼ acres, at a distance of seven miles from the city and 300 feet above its general level. The high pressure thus attained is utilized through a 'Hydraulic Power Works,' and furnishes motive power for elevators, light machinery, etc. With a steadily diminishing water-rate the city has been able to meet not only all the expenses including interest, but also to accumulate a sinking fund.

In 1894 the city took over the street-car system; by the terms of the original contract it did not have to pay a cent for the plant, but received from the company a total sum of \$225,000 in rental money, and had exacted another sum known as the renewal fund to keep the system in repair. Since then a new set of commodious cars has been put in, certain extensions have been made, and the horse-car service has been replaced by a modern electric traction system, all completed by the summer of 1901. After carrying out all of the improvements and charging the low rate of one cent for short rides and two cents for long ones, and after having reduced the hours of its employees from fourteen (under the rule of the company) to ten, and advanced their wages, the city has managed not only to pay all expenses, including depreciation and interest on capital, but it lays aside annually about \$300,000 in the sinking and general reserve funds.

Glasgow possesses a system of municipal markets, used, however, for wholesale transactions only. All slaughtering is done in the municipal abattoirs, yielding an income to the city of some \$100,000 per annum. Under the name of the Clyde Navigation Trust, the city operates the harbor ferries, and holds a monopoly of all

harbor services, reaping an annual revenue of about \$2,000,000. Glasgow has no municipal library, but a private library known as the Mitchell Library receives a grant from the city corporation, and serves the purpose of a public library. It contains about 120,000 volumes.

The schools are managed very successfully by the Glasgow School Board, as may be seen from the increasing attendance in public schools and the diminishing numbers in private ones. Thus in 1880 the enrollment in public schools was 37,263; in Roman Catholic, 13,864; in all others, 19,080. In 1890 the respective figures were 65,000, 15,000, and 6000, in round numbers. A system of fees prevails in the schools which divides them into three distinct classes, each aiming to furnish the same kind of education, but serving to separate the children of the rich from those of the poor. The fees, however, are insufficient to cover all the expenses. There are a number of technical schools, governed by a board of trustees, on which the Glasgow University is also represented. In addition to the university (see GLASGOW UNIVERSITY), which since 1902 has benefited by Mr. Carnegie's munificent gift to Scotch universities of \$10,000,000, there are the Glasgow and West of Scotland Technical College, Saint Mungo's College, Anderson's College, and Saint Margaret's College for women. The secondary schools include the High School, Glasgow, and Kelvinside academies, and the Hutcheson Trust schools. There are numerous hospitals and dispensaries, and three large, excellently appointed general infirmaries. Glasgow has a number of theatres and large concert halls. The Botanic Gardens near the Western Infirmary, with their large conservatories and fine collections of exotic and other plants, form a favorite resort for the citizens. The other large parks are the Glasgow Green on the Clyde, the new West End Park (Kelvin Grove), containing beautiful hills, and Queen's Park on the south side. Population, in 1891, 565,000; in 1901 (of royal and municipal burgh), 760,423. Glasgow is the seat of a United States consul.

Glasgow traces its beginnings in tradition to the little wooden church which Saint Kentigern, apostle to the Scots, built on the banks of the Molendivar about A.D. 560. Nothing is known of the town for more than five hundred years, till David, Prince of Cumbria, the future King David I., in 1116, re-established the See of Glasgow and rebuilt its church. Between 1175 and 1178 Glasgow was made a burgh, subject to its bishop, whose bailie and provosts administered its affairs. In 1450 it was made a regality; in 1611 it gained by charter the right of electing its magistrates, and in 1636 became a free royal burgh. Its university, modeled on that of Bologna, was founded by a Papal bull in 1451. In the seventeenth century the town was a stronghold of Whiggism and the Reformed religion. The great commercial growth of Glasgow dates from the union with England in 1707. Enjoying equal freedom of trade with English ports, it quickly obtained a large share of the American trade, for which its position on the west coast fitted it especially. Glasgow became the chief emporium of the tobacco trade, and its Virginian merchants formed a local aristocracy, remarkable for wealth and distinction. This trade was at length paralyzed by the American war; but

sugar cultivation in the West Indies and the introduction of the cotton manufacture opened up new paths to wealth.

GLASGOW. A city and the county-seat of Barren County, Ky., 100 miles south of Louisville; on a branch road connecting with the Louisville and Nashville Railroad (Map: Kentucky, F 3). It has the Liberty Female College. The city is in the oil region of the State, and its industrial establishments include flour-mills, lumber-mills, handle-factories, a woolen-mill, etc. Population, in 1890, 2051; in 1900, 2019.

GLASGOW UNIVERSITY. One of the great seats of learning in Scotland. It was founded in 1451 by Bishop Turnbull, its foundation being ratified by a Papal bull of Nicholas V. In 1460 James, first Lord Hamilton, bequeathed a tenement and four acres of ground to the Regents of the 'Pædagogium,' or college of arts, and the university was further endowed by Queen Mary, as well as by her son, James VI. of Scotland, better known as James I. of England, who issued a new charter to the institution. The chief prosperity of the university, however, dates from the middle of the nineteenth century. In 1864 the university buildings and adjacent lands were sold, and splendid new buildings were erected on a site overlooking the Kelvin River, at a cost of about £470,000. These were opened in 1870, and have been extensively added to since 1892. By acts of Parliament, in 1858 and 1889, the university has been entirely reorganized, and is now a corporation consisting of a chancellor, rector, dean of faculties, principal, professors, and students. The university court consists of the rector, the principal, the Lord Provost of Glasgow, and various assessors, representing both city and university. This body administers the property of the institution, appoints and regulates professors, and acts as court of appeal from the senate, which consists of the principal and professors, and regulates teaching and discipline. The general council, consisting of various ex-officio members and all masters and doctors, meets twice a year to revise the business of the university. It elects the chancellor, four assessors to the court, and, with the general council of Aberdeen University, returns one member to Parliament. There is also a students' representative council. The chancellor holds office for life; the rector, generally some man distinguished in politics or letters, is chosen triennially by the students. The duties of the latter are wholly

honorary. The students retain many of the earlier customs and rights of mediæval universities, of which the election of the rector is one. They are still divided into four 'nations'—Glotiana (Lanarkshire), Transforthana (Scotland north of the Forth), Rothseiana (Bute, Renfrew, and Ayr), and Loudoniana (all others).

The university grants degrees in arts, science, medicine and surgery, divinity, and law. It is possessed of a library of 210,000 volumes, an observatory, and a botanical garden, besides many special collections of books, apparatus, and the great Hunterian collection of coins, medals, and anatomical preparations. One of the important features of the university is the number of scholarships, exhibitions, and fellowships in its gift, among which the Snell exhibitions are the oldest and richest.

The University of Glasgow is rich in the number of distinguished graduates and teachers. Among them may be mentioned Bishop William Elphinstone, John Major, John Spottiswoode, Andrew Melville, James Melville, Robert Boyd of Trochrigg, John Cameron, Zachary Boyd, Robert Baillie, James Dalrymple, first Viscount Stair, Gilbert Burnet (Bishop of Salisbury), John Douglas (Bishop of Salisbury), Dr. Robert Simson, Francis Hutcheson, Dr. William Hunter, Dr. James Moor, Adam Smith, Dr. Thomas Reid, Dr. William Cullen, Dr. Joseph Black, Dr. Matthew Baillie, Prof. John Miller, Thomas Thomson, Francis Jeffrey, J. G. Lockhart, Sir William Hamilton, Archbishop Tait, Prof. R. C. Jebb, Lord Kelvin, and Sir Joseph Lister. The four hundred and fiftieth anniversary of the foundation of Glasgow University was celebrated with much pomp in 1901; and in the various publications of that celebration is to be found much valuable information regarding the institution. Consult also: Stewart, *The University of Glasgow* (Glasgow, 1891); and the *Glasgow University Calendar*.

GLASS (from AS. *glas*, Icel., OHG. *glas*, Ger. *Glas*; connected with Icel. *gler*, AS. *glær*, amber, and ultimately with Eng. *glare*). The use of glass came to the West from the East, and for that reason there is a diversity of names among the Indo-European nations. In Greek the usual word is *βᾶλος*, of which the etymology is uncertain. In Latin the word is *vitrum*, which also means *wood*, used for its blue dye, and perhaps points to the fact that the earliest glass known to the Romans was in the form of blue beads. Among the northern peoples the original name of the amber (OHG. *glas*) was transferred to the new material, and has given rise to the English *glass*. The French (*verre*) and most of the other Romance languages have kept the Latin name.

The manufacture of glass was known to the Egyptians at a very early date. Tombs of the fourth and fifth dynasties (c.4000 B.C.) show glass-blowers at work, and glazed pottery in the form of beads occurs in prehistoric times, though true glass first appears later in the form of opaque 'paste,' and finally as transparent glass. The oldest example of dark-blue glass is a pendant found at Naqada, which seems to date from the seventh dynasty, though no other specimens of this manufacture are known before the eighteenth. The fullest information as to the processes and materials used by the Egyptians is furnished by the discovery of the glass-works at

Tell el-Amarna, belonging to the eighteenth dynasty. Here were found fritting-pans in which the first melting of the substances took place, and also many imperfectly fused frits. The ingredients used were silica, lime, alkalies, and copper carbonate, but the exact proportions needed to secure a given color do not seem to have been known, and the exact tint produced must have been largely a matter of chance. They did know, however, that river sand, from the presence of iron, gave a green tinge, and to avoid this used crushed quartz pebbles. After the mixture had been fused until the colors began to appear, it was formed into cakes of paste, and these were again heated until the proper tint was reached. These cakes were fused in crucibles, and allowed to cool in them, so that the impurities rose to the surface or settled at the bottom. The crucibles were then broken away and the impure glass at the top and bottom chipped off, leaving a lump of glass, which was then broken up and softened so that it could be rolled into thick rods. These rods were then drawn out into slender rods or hollow tubes, or rolled into flat strips, and these rods or ribbons were used by the glass-maker to produce beads, vases, or inlaid work. It is noticeable that the vases from this site were not blown, but formed by coating a core of sand with melted glass, and pressing out the foot and lip by hand, while the decoration was produced by rolling in threads of colored glass. (Consult Petrie, *Tell el-Amarna*, London, 1894.) In general, glass was used for the manufacture of small objects, and especially for the imitation of precious stones, in which the later workmen attained extraordinary skill. Cutting and engraving were also early practiced. Apart from these independent uses of glass, it was very largely employed for inlaying, while an enamel or glaze on clay, stone, or wood was a favorite form of decoration from early times. A very large proportion of the scarabei, amulets, and small ornaments found in Egypt or exported to foreign parts are of various earths covered with a vitreous glaze, producing the ware incorrectly termed 'Egyptian porcelain.' However empirical the methods of the Egyptians, there can be no doubt of the technical skill attained, and even in Roman times the Alexandrian glass-workers maintained their preëminence. It was not till the Hellenistic period that value seems to have been set on clear glass, for though known earlier, it is certain that Egyptian taste valued only the highly colored varieties.

PHENICIA. Tyre and Sidon were celebrated for their glass, and Pliny (*Hist. Nat.*, 36, 190) locates its invention at the mouth of the river Belus in Phœnicia. His story is that the crew of a ship laden with nitre landed at this point, and when preparing to cook their food found no stones on which to rest the kettle. They therefore used lumps of nitre from the ship, and as these were fused with the fine sand a stream of liquid glass flowed out. Glass was certainly known long before the Phœnicians manufactured it, and the heat of an ordinary fire would be quite insufficient to fuse glass, but the fact remains that the river Belus was always an inexhaustible mine for ancient glass-workers, and modern travelers still describe the white sands heaped on each side of the stream. The glass-factories of Tyre and Sidon were among the most noted of ancient times and remained conspicuous under the Ro-

man emperors. Sidon is credited with the invention of mirrors. She certainly produced the best in the world in her time, and knew the value of manganese in making glass clear. The artisans of this city used the blowpipe, the lathe, the graver, and the casting-plate with splendid results. But the Phœnicians did little more than carry on the processes learned from the Egyptians. They were not great artists, but skillful fabricators and traders, and as a result their glass is found throughout the Mediterranean. The date of any single piece is usually hard to determine, nor is it of great importance, as there are but slight variations in style at different periods and little advance in technical skill. Indeed, it is often impossible to say whether a specimen is of Phœnician or Egyptian manufacture, and some authorities maintain that there are no unquestionable examples of Phœnician glass before the Græco-Roman period.

ASSYRIA AND BABYLONIA. Though glass is scarcely found in the Mesopotamian ruins, glazed or enameled bricks, statuettes, and small objects are numerous. Transparent glass was also known, and a fine example is the bowl of transparent green, now in the British Museum, bearing the name of King Sargon (B.C. 722). This bowl is not blown, but turned and cut from a lump of cool glass. It seems probable that this and other objects of transparent glass are importations from Phœnicia.

PERSIA. The use of enameled bricks for wall decorations was continued by the Persian kings, and the Louvre contains parts of the friezes representing lions and the royal guard which adorned the palace of Xerxes at Persepolis. The beautiful enamels of Persia are famous, and her delicate, lace-like porcelain, filled with transparent glass, is celebrated as Gamberon ware. In the Paris Bibliothèque is the famous cup of Khosru I., King of Persia (A.D. 532), a shallow bowl of crystal with the monarch's figure in relief in the central medallion, encircled with disks of red and white alternating with green, the whole glass ornamented in relief and bound with gold.

CHINA AND INDIA. The Chinese claim that glass and even lenses were known and manufactured by them as far back as B.C. 2000, but the claim is most improbable, and it is not likely the art was introduced before the Christian Era. Modern Chinese glass-works imitate agate and other stones beautifully. All their glass is made from pulverized quartz, as is done in Japan and India. The Hindus, Siamese, and Chinese have from time immemorial placed lumps of glass on the high parts of their buildings to avert lightning. Indian enamellers have been celebrated from ancient times, but they work with simplest processes. The mosaic industry of Agra originated in the Taj Mahal, for which Italian artists were imported. Glass has never been used for windows in the far East, except rarely in palaces, and to the present day oiled paper is the usual glazing throughout China, the palace windows being usually filled with mother-of-pearl or tortoise-shell.

GREECE. Homer does not mention glass (unless the word *κλῆρος*, *kyanos*, denotes a blue glass paste, such as decorated the alabaster frieze found at Tiryns), but excavations have shown that beads and such small objects were known in Greece during the Mycænæan period, though no

fragments of glass vessels have been discovered. It seems probable that these objects were imported, as there is no trace of the manufacture of glass on Greek soil, even in much later times. Even the word *balos* is not used in the sense of glass before Aristophanes (B.C. 425), and then it refers to vessels used at the Persian Court. In later times undoubtedly Greek artistic training exercised a powerful influence upon the glass-makers, some of whom bore Greek names, but the industry never became Hellenic, and Egypt, especially Alexandria, and Syria remained until Roman times the chief sources for fine glass.

ROME. In Italy glass first appears at the very beginning of the Iron Age, in the cemeteries of the Villanova type, naturally in the form of beads and other paste ornaments. Glass bowls and bottles, however, are found in Etruscan tombs, and with the extension of the Roman power the use of glass increased enormously. Not only was glass imported from the old seats of this industry, but the manufacture was introduced into Italy, and thence into the provinces of Gaul, Spain, and Germany. Here, as in Italy, glass and iron had been introduced together, but only ornaments, beads, amulets, etc., were purchased from traders. Under the favorable conditions the industry flourished greatly, and glass became so cheap that ordinary cups or platters were sold in Strabo's time for a farthing, and in the time of Juvenal and Martial poor peddlers traded sulphur for broken glass. On the other hand, the expensive and beautiful vessels, according to Pliny, had almost driven out the use of gold and silver. The absence of fine porcelain led to a much more extensive use of glass than in modern times, and the skill of the ancient artists was equal to the production of works scarcely surpassed in later times. In variety of shapes and in some points of technique the Venetians surpassed the ancient Romans; the special merit of the ancient workmen is in the beauty of the coloring and the skill with which the various threads or layers are combined, producing the effect of onyx and agate. The glass was *blown, cast, pressed, ground, and cut*. It was used for drinking-cups, flasks, bowls, and other vessels, for mosaics, small ornaments of various kinds, and especially for imitations of precious stones, which in many cases were finely engraved as intaglios or cameos. Two methods of decorating are of special beauty. In one the workman blew the glass in two layers, the inner of a dark color, usually blue, and the outer of white. The outer layer was then cut away on the wheel, leaving the design in white relief on the dark background, as in a cameo. The most famous example of this technique is the Portland Vase (q.v.) in the British Museum, though another fine specimen is in Naples, and fragments are very common. The second method is represented by but few specimens, all apparently egg-shaped cups without a foot. The vessel is inclosed in a network of rings of glass which are attached only by slender filaments to the surface of the cup. They seem to have been produced by cutting away the outer surface of the original vessel, an exceedingly delicate and tedious process, though some authorities hold that the outer network has been applied while soft and worked out with the forceps. See especially Fröhner, *La Verrerie Antique* (Le Pecq, 1879), an account of the Charcot Collection, with

a full historical introduction and numerous fine colored plates. More popular is Wallace-Dunlop, *History of Glass in the Old World* (London, 1883).

BYZANTIUM. Constantine, on transplanting his capital to Byzantium (A.D. 330), selected the best artisans in glass, and not only gave them studios in a quarter of the city called 'glass-making,' but caused them to be exempt from the tax levied by previous emperors. Accordingly glass-makers flocked from fallen Rome, carrying the fame and skill of the Imperial city to the East, and Byzantium supplied all Europe with *verre de luxe* until the rise of Venice. Factories were re-established in Greece, Macedonia, Phœnicia, and Alexandria, and after the Arab conquest they continued to be the sole sources of artistic glass through the Middle Ages. The early Byzantines followed classic models, often badly, but later a Byzantine school arose which prevailed throughout Europe until the thirteenth century. Mosaic art, under the impetus of Christianity, was developed to its greatest glory for mural decoration, as the Byzantines believed and demonstrated that "mosaic is the only painting for eternity." Their world-renowned specimens at Ravenna (A.D. 440) are superior to those of the Romans. In the famous Saint Sophia are mosaics made in the sixth century. On the lower walls these mosaics are of marble, and of glass cubes or tesserae on the upper walls and ceiling. These and its colored windows caused Justinian, its builder, to say, "I have surpassed thee, O Solomon." The Church of the Transfiguration, Mount Sinai, is adorned with precious Byzantine mosaics of the seventh and eighth centuries. The Byzantine churches were usually lighted by a series of small windows around the base of the dome. Some of the original plates of cast glass still remain at Saint Sophia. Colored window-glass is not mentioned till toward the end of the eighth century. A common method of inserting it, which is still practiced in the East, was to perforate slabs of marble, or even the plaster, in patterned openings and place the glass in these.

One of the terms of peace at the beginning of the eighth century between Caliph Walid and Justinian II. was that the latter should furnish a quantity of mosaic for his mosque at Damascus. A series of Byzantine mosaics extends from Constantine to Charlemagne. So late as the eleventh century, Pope Victor III. sent to Constantinople for workers in mosaic. Imitation stones were also made wonderfully well there. The blue cup at Monza (A.D. 600), three inches in diameter, said to be made of a single sapphire; the celebrated emerald table captured at Toledo in the fourteenth century, long believed to be cut from a single emerald, inlaid with gold and precious stones, and valued at 100,000 dinars; and the famous Sacro Catino of Genoa, a shallow dish which passed as one of the most sacred relics of Christendom, the veritable 'Sangraal,' the ransom of a captive king, and supposed to be cut from an emerald until pronounced green glass, in 1761, by a French chemist—were all from Byzantine factories. The precious sacrament cups of glass, used in the Church service, were theirs. They made the glass medallions circulated as test weights for money throughout the large estates of the Fatimite princes, which have been mistaken for coins. These were abolished in 888,

but Venice continued to make glass weights in 1279, as the old Greeks had done. From Byzantine centres the Crusaders brought back into Europe the manufacture of glass, and it is probably from this source that Venice received its early impulse and first lessons in glass-making.

VENICE. Refugees in Venice made glass as early as the fifth century, the abundance of excellent sand and alkaline sea-plants facilitating the industry. Saint Mark's, built in 1159, gave an impetus to mosaic work on the spot, and the taking of Constantinople (1204) drove many Greek workmen to the asylum of Venice, with Byzantine secrets. The interior walls of this church are entirely covered with glass mosaics, representing the principal events of biblical history. The work on these mosaics extended over a period of 250 years. The wonderful color effect and beauty of these mosaics have been eloquently described by Ruskin. With the rise of the Italian painters, mural painting took the place of mosaics for wall decoration, and no mosaics of importance were made after the fifteenth century. But in the meantime the Venetians had turned their attention to the production of ornamental glass, and guarded the secrets of its production with the most jealous care. In 1275 the Council of Venice prohibited the exportation of glass materials. The fear of fire abolished the furnaces, in 1291, from Venice proper to the outlying island of Murano, where the artists formed a small republic and have flourished ever since. The fame of Venetian glass-makers led other countries to tempt them away, but the Council of Ten jealously guarded the secrets of Venetian wealth. No stranger could learn the art. Any workman carrying his skill to another country was followed and ordered back. If he refused to come, his relatives were imprisoned. If he persisted, an emissary was dispatched to kill him. A wandering glass-maker called Paoli was tracked to Normandy, where he was stabbed with a dagger on which was written 'Traitor.' But the Venetian police had no power in Murano, and that island had its own codes and magistrates. Nobles gave their daughters in marriage to glass-workers, and the children were counted of the nobility. The shops of Murano formed, in 1495, a magnificent street a mile long, where every conceivable object was fashioned. The furnaces were small, a few workmen about each, which explains the diversity of design and the scarcity of pure glass, such as only long fusion in large furnaces can produce; but nowhere in the world could the precious products of Murano be matched. The vases and cups were royal presents to every sovereign. Their dishes displaced gold. Many of their wares were in patterns like madreporé coral. Their *mille fiore* was a starry mosaic of white threads combined in a blue ground. A favorite style imitated the pulp of an orange. *Vitro de trina* ware was made of twisted rods of opaque white in clear glass, and most delicate of all was their *lattice*, a lace-like network in exquisite designs. They also secured wonderful effects in mosaic, imitation gems, and cameos. All of these were simply repetitions or extensions of wonders done ages before by the Romans, Greeks, and Egyptians, which had since become lost arts, and all the lightness and wealth of color of ancient glass were exquisitely copied in an endless variety

of fantastic forms. Fishes, lions, dragons, etc., were made to assume grotesque effects with the colors of different wines. They blended two sheets of color into one. They invented aventurine and far surpassed their masters in reticulated glass. About 1300 Murano artists conceived of covering plates of glass with an amalgam of tin and mercury, and their mirrors became proverbially fine. Marco Polo prompted them to manufacture beads for African trade. These beads became very popular, and enormous numbers of them were made, so that now, wherever the trade of the Middle Ages penetrated, they may still be found. These beautiful beads contrast strangely with the vulgar and glittering productions that are now made for the similar purpose of trade with African and Indian tribes. In the early fifteenth century Panfilo Castaldi, a Venetian engrosser of deeds, made movable glass types and printed from them, and tradition says that John Faust, his friend, visited his scriptorium. Modern spectacles were invented by Salvino d'Armati, of Florence, according to the statement on his tombstone (1317). At the beginning of the seventeenth century there were 300 glass-houses in Murano, but at the commencement of the nineteenth century all were gone except a small mosaic factory. The art, however, was not allowed to die out entirely, but was cherished by a few workmen, one of whom, Radi, undertook the work of restoring some of the mosaics at Saint Mark's. Salviati, an Italian lawyer, assisted in the Radi enterprise, and with the aid of English capital two sets of workshops have been established where ancient methods and objects such as mosaics are skillfully copied, and new and beautiful work is also done. The Venetians excel in glass novelties, such as mirrors, beads, tableware, bric-a-brac, and aventurine. Their glass is very soft so that it can be spun, woven, or otherwise fashioned into the daintiest designs. In the production of a single piece, it is said, the glass may be reheated fifty times.

FRANCE. The factories of Poitiers were active during the Roman and Frankish periods, survived the Norman invasion, and were left a legacy to the gentlemen workers of the Middle Ages. Ruins of glass vases abound in the Poitiers territory, and such town names as Vieille, Verrières, Voirie, Verrines, come from their glass-works. The ancient cemeteries of Poitiers and La Vendée yield a rich harvest of glass, and fully 20,000 vases have been found at Terre-Noire, Bordeaux. The Imperial factory of Fontenay, at Forêt-Eu, cradle of all the later Norman glass-works, is supposed to have been founded in the second century, and is surely the oldest in the world. The beautiful Roman glass seen in the museums of France is thought to be of native manufacture. The Merovingian ornaments have a peculiar dynastic mark in the thin gold threads dividing differently colored layers. In 677 many Greek workmen were called to France. Normandy was the first country to give privileges to glass-workers. In the tenth and eleventh centuries four noble families received the special prerogatives of glass-workers, and these were confirmed by successive kings until the eighteenth century. Factories in other parts of France were established by gentlemen from Normandy, and the Crusaders brought back many improvements in glass-working. Charles V. gave all glass-makers exemption from taxes, and later

kings extended this privilege as well as permitting noblemen alone to labor at this art. In 1338 Humbert, Dauphin of Viennois, granted a portion of the forest of Chamborant to a glass-maker to establish factories there, provided he should furnish him 3000 pieces annually. M. Jaquin, in 1656, invented the imitation pearls which are made by lining the beads with fish-scales, instead of the old quicksilver lining, copying the uneven shapes of pearls in perfect mimicry, of all shades. Glass-painting was first developed, if not invented, by the French, the earlier artisans being content with mosaic. Painted glass windows are said to have originated in the school of Limoges, about 800, where a Venetian colony was planted. In all the old French churches the glass-maker's art was conspicuous. The windows of Saint Denis (rebuilt for the sixth time in 1108) are pronounced the oldest mosaic pictures in France. In 1665 Colbert tempted away 18 Venetian workmen, with their secrets, and founded a mirror factory in Paris, which, in 1693, was enlarged and transferred to Saint Gobain, where the manufacture still continues on a grand scale. About this time Thévert rediscovered the *casting* of plate glass, making plates 84 by 50 inches. All previous plate glass had been produced by *blowing*, and was therefore limited in size. For over a hundred years cast plate glass was to be obtained only from these makers. In 1740 a factory for French cylindrical window-glass was established, with German workmen, at Saint Quirin, which became the parent of the modern French, Belgian, and English plate-glass works. In 1823 D'Arques established the world-renowned 'crystal-lerie de Baccarat.'

GERMANY. Roman glass has been found in abundance along the Rhine, a fact which indicates the early date of local manufactures. The Frankish jewels were of Teutonic origin. In the ninth century, probably, the Germans taught glass-making to the northern nations. The bishops of early Germany specially encouraged glass-making to dispel pagan idleness with Christian industry. The inhabitants of Tegernsee, Bavaria, have lately held a festival in honor of the invention of glass-painting, which, they claim, dates from the windows of the abbey in that town, made in 999. For a long time painted glass and frescoes were the only library of the people. Lehmann, of Prague, reinvented the casting of glass in molds in the seventeenth century. In 1609 cut glass was first made by him, and it soon outrivalled Italian glass. Cut glass had been made by the ancients, but the art had probably been lost. Bnati, a glass-maker of Murano, worked three years in a Bohemian glass-house, as a porter, to learn its secret, and returned in 1739 to obtain a patent for Bohemian cut glass. Henry Schwanhard, in 1670, invented the etching of glass with hydrofluoric acid. The Electoral glass-works, near Potsdam, established in the eighteenth century, became famous for their gold ruby, invented by Kunkel (1679). Mirror-making was introduced from France in the eighteenth century.

ENGLAND. Great difference of opinion prevails regarding the origin of glass-making in Great Britain, some claiming that it was established before the Roman conquest, and others as late as the sixteenth century. French workmen, in 699, were brought over to glaze Saint Peter's,

York. Benedict established French glass-makers at Wearmouth, 675, for the building of his church; but for centuries glass-making languished in Britain. Henry III. had but one glass drinking-cup, which he specially prized. France taught England the secrets of glass-making. The oldest painted windows in England are those of 1174 in the choir of Canterbury Cathedral, which are as French as those in Saint Denis. As late as the sixteenth century oiled linen was the usual window material, and a century later the royal palaces of Scotland had only the upper rooms glazed. In 1677 the Duke of Buckingham brought glass-makers from Murano to Lambeth to manufacture crystal vases, looking-glasses, and coach-windows. The revocation of the Edict of Nantes (1685) sent many glass-makers to England, and the manufacture speedily improved. Early in the seventeenth century the greatest of modern glass inventions was achieved in England, the making of lead-flint, producing brilliant glass, which was impossible for earlier makers. The famous plate-glass works of Ravenhead were established in 1771. Toward the close of the nineteenth century the art of making glass mosaics was revived in England, largely through the efforts of Sir W. B. Richmond.

UNITED STATES. Prior to the European colonists the only glass known in America was the 'obsidian' volcanic glass. In 1608 some glass-makers were among the artisans brought to Jamestown, Va., but the craze for tobacco interfered with their industry. In 1621 several Italian glass-workers were imported to manufacture beads for the Indians. In 1639 a glass-house was erected at Salem, Mass., and William Penn alludes to a Quaker glass-house in 1683. A glass-maker, Jan Smeedes, received an allotment of land on Manhattan Island, and the business which he carried on gave the name 'Glass-makers' Street' to the present South William Street of New York. In 1754 a Dutch gentleman, Bamber, built glass-works in Brooklyn, N. Y., and the first bottle blown by him, bearing the name and date, is in the collection of the Historical Society of that borough. Glassboro, N. J., was founded by a colony of German glass-makers, who moved there in 1775. In 1787 the Massachusetts Legislature gave to a Boston glass company the exclusive right to make glass in the State for fifteen years. This is said to have been the first successful glass-factory in the United States. Pittsburgh, Pa., first made glass in 1796, and is still a most important glass-making centre. At the very beginning coal was used instead of the traditional wood fuel. This, with the abundance of excellent sand in the adjoining rivers, gave the industry a phenomenal development there, which has been increased by the substitution of gas and oil fuel. In 1827 pressed glass was invented by a carpenter of Sandwich, Mass. With the discovery of a cheaper and better fuel, in the form of natural gas, the centre of glass-making moved west of the Alleghanies, where it still remains. As natural gas has failed, petroleum has been substituted, and proves an excellent fuel. By the close of 1880 the census shows that the glass industry of the United States had been brought to a very extensive and prosperous condition. There were then 211 factories, employing 24,177 men, sending out an annual product worth \$21,154,571. In 1890 the number of

factories had increased to 294, and the product to \$41,051,004, and in 1895 the product was \$47,600,000. Within recent years artistic glassware of great beauty has been produced in the United States, a notable example of which is the famous 'Favrille' glass of the Tiffany Company of New York. The United States still imports more glass than she exports, the exports being that peculiar product of Yankee ingenuity—pressed glass.

aluminum, and calcium; *Venetian glass*, of sodium, potassium, and calcium. Sodium, potassium, calcium, and lead are the bases that form almost all glasses. To obtain the silica, sand is now generally used, river or sea sand sufficing for cheap grades, in spite of the impurities; but for fine qualities the sand is quarried. American sand is pronounced by experts superior to English and French. The principal deposits are in Massachusetts, Pennsylvania, West Virginia, Illi-

GLASS INDUSTRY IN THE UNITED STATES, 1850-1900

CHEMICAL AND PHYSICAL PROPERTIES. Chemically, any vitreous compound is called glass, but commercially glass is a fused mixture of two or more metallic silicates, and is often named from the predominant base, as 'soda glass,' 'potash glass,' 'lime glass,' and 'lead glass.' The essential ingredients are silica and alkali. *Flint glass* is a mixture of the silicates of lead and potassium; *Bohemian glass*, of the silicates of potassium and calcium; *plate or sheet glass*, of the silicates of calcium and sodium; *bottle-glass* is a mixture of the silicates of sodium,

nois, Missouri, Ohio, Indiana, New Jersey, New York, and Maryland, but good sand is abundant all over the United States.

Ancient glass was commonly a soda glass, one part of sand to three of crude soda, and, therefore, was soft, decomposing easily. The inferior soda, made from the ashes of sea-plants, was succeeded by soda-ash, made from salt by Leblanc's prize discovery of 1792, which opened a new era in glass-making. Since 1875 'salt-cake,' sulphate of soda, has been largely used, producing a harder glass of a bluish color, while the carbonate of glass is softer and yellowish. The use of potash as an ingredient dates from the Middle Ages. It is made from the mineral chloride by the Leblanc process, similar to the manufacture of soda-ash from salt. Lime, next to silica in importance in producing toughness, is a modern discovery. Of old, it was used sparingly as a cheap substitute for soda and potash; now, with improved facilities, it produces 'lime-flint,' unequalled for lightness and beauty in common wares. It is used in the form of carbonate of lime, which is a staple compound, while burned or slaked lime constantly changes its chemical composition. Lead oxide (litharge) began in the seventeenth century to produce the heaviness and brilliancy of the English flint glass now made in every industrial country. Another oxide of lead, called red lead, is also used in modern glass, and is said to be preferable on account of its excess of oxygen. Other ingredients, as barium, zinc, and lithium, are used in special glasses. Manganese is introduced in modern glass as a decolorizer, to correct the greenish tint produced by iron, which is an unwelcome ingredient of nearly all materials. Arsenic, and carbon in the form of charcoal or coal, are aids to the decomposition of the batch. The proportions of the ingredients differ widely among various establishments.

Potassic silicate is colorless, and contributes brilliancy and fusibility; sodic silicate is also bright and fusible, but imparts a sea-green tint; plumbic silicate increases the fusibility, ductility, and brilliancy of glass. If an excess of any material is used it affects the quality of the glass. Too much alkali tends to make the glass spotted, scaly, rough, or cordy; excess of lime

Molten glass is an amorphous substance, but when allowed to stand undisturbed for hours it will crystallize. This process is called devitrification. The accompanying table, showing the components of different varieties of glass, was taken from an article on "Glass," by Robert Linton, in *The Mineral Industry*, for the year 1899 (New York, 1900):

prevents cords, but tends to make the glass brittle and liable to devitrify; if there is too much sand it is impossible thoroughly to melt the glass, and it is full of stones, seeds, strings, and other imperfections. The imperfections so common in flint glass are due to the fact that it is composed of the silicates of lead and potassium, materials so different in their specific gravities that when fused together veins and cords are likely to be produced. It is this tendency which makes a perfect optical flint glass so hard to produce. The specific gravities of various kinds of glass are as follows: Window-glass, 2.50 to 2.70; plate glass, 2.40 to 2.50; bottle-glass, 2.60 to 2.70; lead-flint glass, 2.80 to 3.25. Hydrofluoric acid is the only acid known which will dissolve glass. Glass is slightly acted on by alkaline solutions, by light, air, and boiling water. It is usually transparent, or at least translucent.

The most important property of glass, however, is the condition of viscosity, intermediate between solidity and liquidity, which it assumes when the ingredients of which it is composed have been thoroughly fused and are maintained at the proper temperature. In this semi-liquid state it may be blown into any hollow form like a bubble, spun into the finest thread, or pressed or cast into any desired shape. This property of glass will be considered farther on as the different methods of manufacture are described.

PREPARATION OF THE MATERIAL. Sand being the commercial representative of silica, it is evident that the quality of glass depends, apart from the effect of different processes of manufacture, upon the quality of the sand, and the more thoroughly the sand can be cleansed of impurities before it is melted, the better will be the quality of the glass. Hence, for the finer qualities of glass, the sand is often subjected to a preliminary process of purification by washing, burning, and sifting. The sand is *washed* by stirring it thoroughly in large volumes of water and then allowing it to settle; the lighter particles of dirt, chalk, and other extraneous matter will remain in suspension after the heavier sand has settled, and can be drawn off. The sand is *burned* to remove the moisture and organic matter; it is placed in the bed of an oven and played upon directly by the flame. Last of all, it is *sifted* through copper gauze. The chief impurities found in sand are iron, lime, alumina, chalk, and magnesia, besides organic matter and dirt. Of these the iron is the most troublesome, so that it is customary to estimate the value of sand according to the amount of iron which it contains.

The process of mixing the prepared sand with the other ingredients is called 'mixing the batch,' the batch being the mechanical mixture of the materials whose chemical combination, brought

about by heat, produces glass. It is evident that the materials of which glass is to be made must be mixed with the greatest nicety, knowledge, and skill, if a perfect product is to be obtained. Herefore the proportioning of materials has been done empirically, but in the best modern factories there is more dependence put upon chemical analyses to determine the proper mixture. The accompanying table, compiled from figures in *The Mineral Industry*, previously referred to, shows the mixes for American glass as prescribed in three different glass-makers' recipe-books. While it is true that a practical glass-maker might not follow any of these recipes exactly, but would have to modify them to suit the peculiar requirements of his own material and furnaces, yet they will serve to give a general idea of the average composition of the batches from which some of the different kinds of glass are made in America.

FURNACES AND FUEL. The furnaces used for melting glass are of two general types, pot furnaces and tank furnaces. The traditional furnace, still the type of pot furnace for flint-glass melting, is round, with from eight to twelve 'monkey pots' in a circle around the central fire, at the base of an enormous chimney. The monkey pot is an oval cylinder with a round top, open only on the upper part of one side. Each one is inclosed in an arch of fire-brick, with its mouth only visible outside, and when it cracks the heat must be lowered and the arch torn down, while the red-hot crucible is dragged out and another substituted for it. The melting-pots play a very important part, and demand the most careful preparation. The slightest flaw is discovered by

mens, and this type of furnace is in wide use in Europe and America.

REGENERATIVE OPEN-POT FURNACE.

SECTION OF WINDOW-GLASS TANK FURNACE, BAUDOUX-PAGOULET TYPE.

the intense heat, and the precious contents are emptied into the well below the furnace. The clay is most carefully selected, but after months of labor in its construction, the monkey pot

In these furnaces the gas is generally produced from coal outside of the furnace, mixed with the air, on the principle of the Bunsen burner. In the United States natural gas, and later on petroleum, have been largely used as a fuel. Instead of melting-pots there is a tank, constructed from pot-clay, covering the whole area of the furnace, and divided by floating partitions into compartments. The melting compartment at the rear receives the raw material through the doors. As this melts it flows into the refining compartment, where a higher temperature purifies it till it flows under the second partition into the gathering compartment, and there a lower temperature thickens it for the blower. A re-

cent improvement dispenses with the floating partitions by the use of floating vessels, which gather the molten glass at the lowest depths in the tank and raise it to the surface to be completely refined in a special compartment, whence, as it sinks in perfect fusion (the best glass being the heaviest), it can only flow into the working-out compartment. The depth of the floaters is usually one-fourth the depth of the tank. These tank furnaces may be worked continuously, with no change in temperature, and no discoloration from smoke, and on a colossal scale.

Improvements in the methods of glass manufacture have all been in the direction of substituting gaseous for solid fuel. Even in pot-furnaces gas is preferred, and for a tank furnace it is indispensable. Natural gas is the ideal fuel, but is very limited in its occurrence, and when it cannot be obtained gas is manufactured from other fuel. Its advantages are its freedom from ashes and other dirt, and the ease with which the flame may be applied and controlled. A commercial classification of glass and of the principal types of furnaces producing it may be given as follows: (1) *Polished plate* embraces all glass cast upon a smooth table, rolled to the required thickness with a roller, annealed, and then ground and polished. Under this head comes *thin plate*, a recently developed process. (2) *Rough plate* includes all glass cast as above, but not ground and polished. The principal varieties are *ribbed plate*, *colored cathedral*, *rough plate*, *wire glass*, *heavy rough plate* for skylights. (3) *Window-glass* embraces all glass blown in cylinders and afterwards cut and flattened out and polished while hot. Chiefly used for pictures and mirrors. (4) *Crown glass* is glass blown in spherical form and flattened to a disk shape by centrifugal motion of blowpipe. A little is now made for decorative purposes. (5) *Green glass*. All the common kinds of glass, and not necessarily green in color. Used in manufacture of bottles, fruit-jars, etc. (6) *Lime flint* includes the finer kinds of bottle-glass, certain lines of pressed tableware, and many novelties. (7) *Lead flint* embraces all the finest products of glass-making, such as cut glass, fine tableware, artificial gems, and optical glass.

The principal furnaces are: (1) Open-pot furnaces for bottles and window-glass; (2) open-pot furnaces for plate glass; (3) covered-pot furnaces for flint glass; (4) day-tanks, which are practically open-pot furnaces, gas-fired, and with a single tank or pot; (5) regenerative continuous tank furnaces for window-glass; (6) regenerative continuous tank furnaces for bottles; (7) recuperative continuous tank furnaces for bottles.

MANIPULATION. The curious viscosity assumed by molten glass has already been referred to. While in this condition it may be gathered up in a soft mass on the end of a stick, and, if the stick be a tube, the lump may be distended, by blowing through the tube, into a hollow sphere. The form of this sphere or bulb may be modified by manipulating the pipe, and if a second iron be attached by a seal of glass to the other side of the bulb, it may be drawn out into a tube. If the bulb be opened by removing it from the blowing iron, and then, after attaching it at its opposite side to another iron, be trundled rapidly like a mop, the opening will expand, by centrifugal force, into a disk. These are the

processes which, infinitely diversified and complicated by the skill of the workmen and the nature of the product, constitute the art of the glass-blower. Every melting-furnace has several working furnaces called 'glory-holes,' where the glass-worker reheats his work. These are small blast-furnaces, each affording several openings into the flames.

There are three general methods of shaping glass—by blowing, pressing, and casting.

WINDOW-GLASS is produced in a square or oblong furnace, and requires the most muscular and skillful workmen. The 'monkey pots' are filled with the mixed 'batch,' and when this is melted a second charge is shoveled in, followed, as soon as it flows, by a third and a small amount of 'cullet' (broken glass), which fills the pots. Sixteen hours are consumed in the entire melting, and the master-melter carefully watches his 'monkeys,' forcing the furnaces to their highest heat. As soon as the signs appear indicating that the molten glass or 'metal' is ready to work, the heat is lowered to thicken the glass for the blowers. Each man is trained to one small part of the whole process, and does nothing else. The gatherer holds a mask before his face, by a plug grasped between his teeth, to screen him from the glare of the furnace, and starts the 'journey' of the glass by dipping the blowpipe into the pot several times, dexterously forming on its end an oval mass of the white, hot, gummy 'metal,' which weighs from 20 to 40 pounds, according to the thickness and size of the sheet to be made. Revolving the ball in the glaring pot, he completes its symmetry and consistency, and then turns it in an iron mold till it takes a perfect pear shape. This finishes the gatherer's work, and he hands the fiery sphere to the blower, who is the master-workman of the establishment. He takes the pipe from the gatherer's hand and blows a huge bubble of air into it, then another, and another, swelling the solid sphere into a great decanter, with its thinnest part hardening next the pipe, as one end of the cylinder which is to be evolved from the soft thick mass attached to it. Now he takes his stand on the long narrow platform which leads to his furnace door over a deep pit, swinging the glowing bulb like a giant pendulum into the depths below, persuading it to elongate with frequent puffs at the most effective moments. Now and then, as it cools into hardness, he rests his pipe on a prop and softens the end in the furnace, or he may toss the cylinder above him until it settles into a workable condition. Thus he blows and swings, and heating from time to time the molten mass, he works it till it grows as long as himself and becomes a round-topped cylinder. When this has cooled considerably, he holds the end in the furnace, blows strongly into it, and, covering the mouthpiece with his thumb, an explosive report is heard. The imprisoned air, heated expansively, has burst an opening through the soft extremity. Revolving the end rapidly in the furnace, the blower enlarges the hole by centrifugal force, till it is as large as the diameter of the cylinder. Then he cools it in a pit to a cherry-red, and his part is done. An assistant carries it off and detaches it from the blowpipe by encircling the neck with a thread of hot glass and then touching the line with a cold iron. The cylinder is then cracked lengthwise by a diamond, or by passing a red-hot iron inside it. Next the

flattener takes it. First he warms the split cylinder, then places it on the stone before him, a fire-clay table, which revolves within an oven. The curved sheet opens in the heat like an uneven sheet of paper, and he smooths it by a wooden block. The stone carries it then to the cooling oven, whence it is lifted on an immense fork into a car at the mouth of the 'leer,' or annealing tunnel, and there it is tempered for service.

CROWN GLASS, once the favorite for window-panes, has now shrunk into small importance, and is made for ornamental work only. Though much more brilliant, the plates are small and of tapering thickness. The same molten material as that used for sheet glass is gathered in a smaller globe on the end of a blowpipe, and rolled into a cone on a stone table, or 'marver.' The workman blows it then into a sphere and flattens the under side of it, keeping in the centre the 'bullion point,' or thick apex of the original cone. While he rests the pipe on a horizontal support, another workman with a 'pundy,' or solid iron rod, attaches a small cup of warm glass to the bullion point, and the blower detaches his pipe by touching the neck of the flattened globe with a cold iron and quickly striking it. The pundy-man carries it off with a small hole where it left the blowpipe, and heating it in the furnace and revolving it, the opening enlarges wider and wider until it becomes the 'crown,' which named it, and at last whirls out into a flat disk or 'table.' This is kept incessantly turning till it cools enough to be laid on a support, where it is clipped by shears from the rod, and sent to the annealing-oven. The diameter of such a plate varies from a few inches, like those made in colored glass for fancy windows, to six feet. But the square panes cut from it are always small, as the round lump in the centre, the 'bullion point,' or 'bull's-eye,' must be omitted, though these are sometimes used for decorative purposes.

PLATE GLASS has the same composition as sheet and crown glass, but is melted in vast open vessels (sometimes holding 2½ tons) resting upon frames behind fire-clay doors. After the long fusion is perfect the door is thrown open and the tank is seized by an immense fork mounted on a truck, and carried bodily to the casting-table, where it is hoisted by a crane and poured over the metal bed, which has a very smooth, highly polished surface. A heavy roller passes over it, spreading the glass out in a uniform thickness determined by the height of the strips on either side of the table. Instantly it is rolled into the annealing-oven for a tempering of several days. It comes out in the form of rough plate. To be polished it is fastened by plaster of Paris to a large rotary platform which revolves so that the entire surface is covered at each rotation by the disks of grinding-machines which rub it with sand, then with emery, and last with rouge, first on one side, then on the other, till 40 per cent. of its thickness is removed, and it remains a shining sheet from one-quarter to three-eighths of an inch thick. 'Rolled plate' is cast upon an engraved table, which gives the impressions of fluted lines or fancy patterns in a translucent body of glass adapted to panels and partitions.

GREEN GLASS, or BOTTLE-GLASS, is the coarsest form, made from roughest materials, and is the simplest branch of glass-work. The bottle-blower gathers the molten glass on his blowpipe, in the quantity desired for his bottle, or jar, or demi-

john, puffs a bubble into it, drops the inflated lump into an iron mold, which is closed together over it by a small boy, and blows the glass into its permanent shape with the lettering or trademark which was cut in the mold. The jagged mouth is then rounded in the 'glory-hole,' and the bottle goes to the 'leer.' Bottle-molds are made of brass or iron, and must be maintained at nearly a red heat while being used. The simplest form is of two sides hinged together at the base, and the familiar ridges running up each side of a glass bottle are formed where the two sides of the mold shut together. Sometimes the mold is in three pieces, one for the body and two for the neck, in which case the ridges are only on the neck; this is usually the case with wine-bottles. Formerly the blowing of bottles was done wholly by the breath; but recently machines for blowing fruit-jars and other wide-mouth jars have been successfully operated, and the process will doubtless be extended.

FLINT GLASS broadly includes all the myriad forms of glass except window-panes and dark bottles. The lead, which the true flint glass alone contains, gives it a characteristic brilliancy and weight. The pure English flint is the French 'crystal.' It rings like metal, is heavier than any other glass, and shines as none did before its invention. It is the choicest material for table and cut ware, for optical glass, and for the best blown and pressed ware that fills the household. An extra proportion of lead makes it 'strass,' from which artificial gems are made. The 'lime-flint' has a lighter weight and a lustre approaching 'lead-flint,' but it does not equal its royal superior. From this the ordinary utensils are made.

A flint-glass establishment is the most fascinating of glass-houses, as it generally includes blowing, molding, and pressing. A wine-glass is made from a glowing bulb as large as a peach. A breath swells it into a hollow sphere the size of the bowl. The gatherer attaches a small knob of soft glass, and draws it out into the stem, and on the end of this presses a bell-shaped base, previously hardened, which is flattened out into a stable foundation. Shears cut free the top of the bowl, and the furnace rounds the edge. So, from three pieces, the ordinary wine-glasses and similar-shaped vessels are made. The costlier kind has the stem drawn out of the original sphere, and the base, blown separately like a tiny disk of crown glass, is united by its heat to the upper part. All the best 'hollow ware' is blown either in the air and finished by hand for the higher grades, or in molds, which produce the dimmer surface of common qualities. All transparent druggists' or prescription bottles are of flint glass, but are made like the green glass bottles. A good workman can blow 4800 small 'prescriptions' in a day of ten hours. The combination of colors in flint-glass work is particularly interesting. From the pots, where several hues of glass are fused adjacently, the blower dips two or three contrasting layers, all appearing one, and works them as a single lump into a globe, or shade, or vase. These can be cut in cameo style, or twisted into ingenious displays of their structure. The fancy vases, globes, pitchers, etc., with high or low relief patterns, are blown into molds and finished by hand. The perplexing skein-work of interlaced threads of color in a body of transparent glass is produced by wind-

ing threads of colored glass, which are then shaped into any hollow pattern or pressed solid into pretty marbles. Machinery has been used with marked success in the manufacture of tumblers and lamp-chimneys, and compressed air employed instead of the breath of the glass-blower.

CUT GLASS is first blown into the general shape intended from the brilliant 'crystal,' and then is ground into a cluster of glistening facets. Grindstones, continually moistened by streams of wet sand, cut the rough pattern, and emery wheels, and, finally, putty powder, finish the brilliant angles. The grinding-mills also remove the punty-marks and defective ridges on wine-glasses, etc. 'Ground glass' is made by roughening the surface on these wheels, or by sand-blast, or by etching. The last is done by hydrofluoric acid, often in designs for translucent doors and windows, the unetched part of the glass being protected by a coat of wax. The ornaments on fine drinking-glasses and shades are engraved by copper disks.

PRESSED GLASS, the least expensive and therefore the most abundant form of flint glass, is the American contribution to the industry. The pressing-machine contains a mold of the ink-stand, dish, goblet, vase, or statue to be made, and one man cuts off and drops into it a lump of red-hot glass, while another pulls the lever which shapes the object. By this means unskilled labor can produce perfect results, and the process of manufacture is wonderfully shortened. Pressed glass is often made to imitate Bohemian cut glass, the facets being cast instead of being cut, but the angles are always rounded and the lustre less.

Beads are still made almost entirely in Venice, where over a thousand artisans are devoted to this work alone. The glass is drawn out into long tubes which are filled with sand to prevent their collapse when annealed, and are then cut off into fragments. Colonies of women and children thread them and tie them in bundles to be exported to the ends of the earth. The 'pearl beads' of France, invented by Jaquin in 1656, and made ever since by his heirs, are blown from glass tubes, lined with powdered fish-scales, and filled with wax. The scales of 16,000 fish are required to make one pound of essence of pearl. The finest of them simulate the irregularities of pearls in form and color, and are difficult of detection without special tests.

Imitation gems, long the favorite object of the cleverest artificers, are now nearly obsolete. The base of false gems, 'strass,' is a heavy uncolored flint glass, containing an abnormal proportion of lead to give it weight and brilliancy. See **GEMS, IMITATION**.

COLORLED GLASS is made ordinarily like any others, by the addition of dyes (generally metal oxides) to the molten charge. The same metal produces several colors at different temperatures. Iron gives all the rainbow hues in the order of their position in the spectrum, but its commonest effects are green and orange. Manganese, so staple a decolorizer as to have earned the name 'glass-makers' soap,' produces in excess pink or amethyst. The manganese in old window-glass frequently is betrayed by the analysis of long sunlight in the purple tints that appear. Too high a temperature turns it brown, then yellow, and finally green. Copper makes the reds of

cheap glass, and when heated further turns purple, blue, and green. Cobalt gives rich blue or black. Gold, in the form of 'purple of Cassius,' and in a simple solution, creates the finest rubies, violets, and amber, one part of the precious metal coloring a thousand parts of glass. The exquisite objects of amber glass which shade into red are colored from a gold solution in the crucible, and after being fashioned into the desired shape are held in the 'glory-hole' a few minutes. The second heat transforms the amber to red and the unheated portion remains an amber tint. Silver gives a beautiful yellow, and uranium, green or yellow. Carbon, in powdered coal, is used for cheap black and amber bottles. Opalescent ware, in which modern fancy glass excels, gets its color from cryolite, arsenic, or tin.

Mosaic window-glass is cast like rough plate glass from small ladles, and the desired tints are carefully selected, to be patched together in harmonious designs by leaden joints. See **WINDOW**.

Painted glass is colored by enamels fused to the surface. Stained glass is produced by soluble metal oxides applied with a brush and fastened in the stainer's kiln. 'Flashed glass,' or double glass, is made by coating the embryonic bulb of transparent glass with a dip of colored glass and blowing both as one into a sheet of window-glass, a lantern-globe, or whatever shape is desired. Opaline glass for art windows is made by pouring colored glass of one or more kinds upon white opaque glass and then pressing the whole with a heavy iron roller. This causes the different glasses to intermingle, affording great varieties of color effect. See **STAINED GLASS**.

OPTICAL GLASS is a fine quality of lead-flint, as the density produced by lead causes high refractive power. The fusion, like the whole finishing work, requires special care and patience. The melting-pot is lined with a glaze of broken glass, having been previously very slowly heated for four or five days. The batch is put in a little at a time, and stirred with a fire-clay roller. The molten mass is kept at an intense heat for six or eight hours and stirred, to cause all the bubbles of gas to escape, the process being continued till there are no more bubbles. The pot of glass is now taken from the furnace and put in an annealing-oven and slowly cooled for several days. The glass is then broken up into pieces, the faulty ones rejected, and the perfect ones charged in disk-shaped clay molds, where they are remelted to the form of the mold. These glass disks are now ready for the final annealing, which is performed very slowly and with great care.

WIRE GLASS. Wire glass is simply a combination of wire and glass for use in large buildings like railway stations, where a single wide-arched roof must span an enormous area, and the lighting must be chiefly in this roof. It is also used for ordinary windows in exposed locations, as a precaution against fire or other accident, as the iron of which the netting is composed has a higher fusing-point than the glass in which it is imbedded. When exposed to fire it will retain its shape and hold the glass together even after the latter has become plastic. A wire-glass window forms an admirable fire-screen, and in many cases is a great protection. Ordinary glass panes in a roof are in danger of breaking and falling, and the object sought by the inventor

of wire glass was to secure a material at once lighter and stronger than the ordinary glazed roof windows. The first practical and commercially successful process was patented by Frank Shuman in 1892, and the following year he was awarded a premium by the Franklin Institute for the invention. In the Shuman process a very long cast-iron table is set in the floor and heated by gas-flames from beneath. Over this the molten glass is poured. The woven wire netting is heated nearly as hot as the molten glass. A vehicle holding four rollers and feeding out the red-hot wire is now rolled over the table on a track, one rail of which is on each edge of the table. The first roller smooths and spreads the glass, the second presses deep into the glass the wire netting which slides down an inclined iron table before the roller, the third and fourth rollers complete the process of smoothing and hardening. Wire glass is not readily damaged by vibrations, and is hail-proof. Its strength enables it to support great weights of snow and to resist flying particles that would break through ordinary glass.

ANNEALING has been referred to already, but it is such an essential part of the art of glass-making that it requires more detailed explanation. In order that glass shall have strength and durability, it must, after it has been fashioned into shape by some process, be cooled more gradually than is possible in the temperature of the open air. This is necessary in order that the pores, which have been distended by heat, may contract evenly throughout the substance instead of closing more rapidly on the surface than inside. In order to effect this, annealing-ovens are used in which the temperature is so regulated that the cooling proceeds with extreme slowness, as many as four weeks being required to bring optical glass to its normal temperature. Two kinds of annealing-ovens are in use, the intermittent and the continuous. An intermittent kiln is simply a gas-heated oven with a hearth on which the glass is laid. When the heated kiln is filled with ware it is sealed up and allowed to cool by draughts, which are so regulated that the temperature can be perfectly controlled at every step of the process. In annealing plate glass there is a separate oven for each sheet. Continuous kilns or 'leers' are displacing the intermittent kilns for many forms of glass. The oven is a long narrow passage with the fire at one end, so that the temperature constantly lowers as the other end is approached. An endless chain, with pans on it for holding the glass, is slowly dragged through the oven, and by the time a pan has traveled from the fire to the cold end of the oven the glass in it is properly annealed. Several processes for rendering glass still tougher than it is made in the annealing-oven have been invented. M. de la Bastie has succeeded in imparting considerable toughness to glass by plunging it, while hot, into a bath of oil or melted fat. This process has proved only partially successful, and is not adapted to window-panes, because glass treated in this way will not cut with the diamond. Another method is in the manufacture of 'Verbundglas,' or compound glass, which was originated at the works of Schott & Genossen, at Jena, Germany. The glass is made of two layers which expand at different temperatures, one of them being flashed over the other. This glass is especially adapted

for chemical vessels, thermometers, lamp-chimneys, or, in fact, for any use in which the exterior and interior surfaces are subjected to widely different temperatures.

There are many strange uses of glass. Threads may be drawn on a reel from molten glass, making a transparent mineral silk fine enough to weave into cloth, or to fashion into fancy plumage. It has been found possible to weave glass into fabrics, sometimes with a warp of silk, and to shape it into collars, neckties, brushes, lamp-wicks, etc. M. Dubus Bonnet, of Lille, France, has invented a process of spinning and weaving glass into cloth. The warp is composed of silk, forming the groundwork, on which the pattern in glass appears, as effected by the weft. The requisite flexibility of glass thread for manufacturing purposes is due to its extreme fineness, as not less than from 50 to 60 of the original strands form one thread. *Mineral wool* is made from the slag-glass refuse of iron-smelting, being blown into fine shreds by a blast, to fill walls and floors with a fire-proof and rat-proof padding, and for other unique services. *Réamur's porcelain* is an opaque and porcelain-like glass, which has been 'devitrified' by great heat and gradual cooling, becoming marvelously tough. *Soluble glass* is a highly alkaline solution of minerals composing glass, which is applied to textures in theatres and elsewhere to render them fire-proof. Fire touching them melts the invisible minerals into a glaze which excludes air and prevents combustion. M. de la Bastie introduced into Europe transmuted glass, which is tougher than cast iron. *Malleable glass* is one of the legends descending from the ancients which may be some day verified.

Among the authorities on glass are: For the history of the art, Gaudy, *Romance of Glass Making* (London, 1898); for the scientific side, Powell, Chance, and Harris, *The Principles of Glass Making* (London, 1883); the chapter on 'Glass,' by Linton, in *The Mineral Industry for 1899* (New York, 1900), and Biser, *Elements of Glass and Glass Making* (1900); and Austin, report on glass in *Twelfth Census of the United States* (Washington, 1902).

GLASS, SOLUBLE. See WATER GLASS.

GLASSBRENNER, gläs'brén-nēr, ADOLF (1810-76). A German humorous and satirical writer, born in Berlin. From 1831 to 1833 he was editor of the Berlin periodical *Don Quixote*, which in the latter year was suppressed by the Ministry. He first became known through his series, *Berlin wie es ist und—trinkt* (33 parts, 1832-50), which originated the Berlin local type of popular humor, much imitated by others. His best work is the comic epic *Neuer Reinicke Fuchs* (1845; often reprinted). From 1858 until his death he edited the *Berliner Montagspost*.

GLASSCHORD. A musical instrument, with keys like a pianoforte, but with bars of glass instead of strings of wire. It was invented in Paris in 1785 by a German called Beyer. The name glasschord was given to the instrument by Franklin. When the glasschord was completed, it was exhibited publicly in Paris, and performed on by the inventor; but it never was received with favor by the instrument-makers, so that no more were ever made. See HARMONICA.

GLASS-CRAB. A larval form of certain macrurous decapoda (q.v.). They were formerly ranked as a separate group of crustaceans. They are remarkable for the transparency of their bodies, whence their name. They have little resemblance to crabs. The head is represented by a large oval plate, bearing eyes mounted on very long stalks; a second plate, the breadth of which much exceeds its length, represents the thorax, and bears the feet, most of which are long, and some of them, as in other crustaceans, bifid, with one branch much longer than the other. The abdomen is small. These creatures have no special organs of respiration, but the blood is aerated through the general surface of the body. They are found in tropical and subtropical seas; and so transparent are they that when floating on the surface of the water they would not be perceived but for the beautiful blue of their eyes.

GLASSE, gläs, HANNAH. The author of *The Art of Cookery* (1747). The only hints of her personality are the mention of a "Mrs. Glasse, Cary Street," among the subscribers to the first edition, which was published anonymously, and the advertisement in the fourth edition (1770) of *Hannah Glasse, Habit Maker to H. R. H. the Princess of Wales, in Tavistock Street, Covent Garden. The Art of Cookery Made Plain and Easy* is ascribed to Dr. John Hill in Boswell's *Johnson*, but this is improbable. Mrs. Glasse wrote *The Compleat Confectioner* (c. 1770), and *The Servants' Directory, or Housekeeper's Companion* (1770). The famous direction, "First catch your hare," although often referred to *The Art of Cookery*, is not to be found there.

GLASSEYE. The wall-eyed pike (*Stizostedion vitreum*). See PIKE-PERCH.

GLASSITES, gläs'its. See SANDEMANIANS.

GLASSON, gläs'son', ERNEST DÉSIRÉ (1839—). A French jurist, born at Noyon. He was educated at Strassburg, was admitted to the bar, and, after teaching a year at Strassburg, went to Nancy as a member of the new legal faculty. In 1899 he was appointed dean of the faculty of law at the University of Paris. He did much to popularize the study of comparative legislation. His works include: *Du consentement des époux au mariage* (1866); *Eléments du droit français dans ses rapports avec le droit naturel et l'économie politique* (2d ed. 1884); *Le mariage civil et le divorce* (1879); *Histoire du droit et des institutions de l'Angleterre* (1881-83); *Le code civil et la question ouvrière* (1886); and *Histoire du droit et des institutions de la France* (1887-96). Glasson acted as editor of the legal department of *La Grande Encyclopédie*, and contributed to many technical journals.

GLASS PAPER, or CLOTH. An abrasive surface made by powdering glass more or less finely, and sprinkling it over paper or calico still wet with a coat of thin glue; the powdered glass adheres as it dries. Glass paper is very extensively employed as a means for polishing metal and woodwork, and is sold in sheets.

GLASS SNAIL. A very small, almost transparent snail of the genus *Vitrina*, species of which are common in the northerly United States. These glassy snails are remarkably hardy in reference to cold, and consequently are found higher up on mountains than most snails are able to live.

GLASS SNAKE. See BLINDWORM.

GLASTONBURY. A market-town and municipal borough in Somerset, England, situated on a peninsula formed by a winding of the river Brue, 25 miles southwest of Bath (Map: England, D 5). It has some manufactures, an export trade, and in the vicinity are chalybeate springs which formerly attracted health-seekers. Population, in 1891, 4119; in 1901, 4016. It is important as the cradle of English tradition and history, and the great unbroken link between modern, mediæval, and early British Christianity. Its chief material interest lies in the ruins of its splendid abbey founded in the sixth century. Of this magnificent pile, which covered sixty acres, the only remains are parts of the abbey church, with the roofless chapels of Saint Joseph and of Saint Mary, and the Abbot's Kitchen, a square, massive, and strongly buttressed structure, all especially important as specimens of early and transitional architecture. A causeway across Sedgemoor and many of the houses of the town are built from the materials of the abbey, which became a common and prolific quarry for the neighborhood. Other buildings and places of interest are the George Inn, a pilgrims' hostelry of the fifteenth century; the two parish churches, the Tribunal, the Abbot's Barn, Wearyall Hill, and the Tor, 500 feet high, from which a fine view is obtained. Two miles to the southwest lies Sharpsham Park, where Fielding the novelist was born.

Glastonbury has prehistoric remains of a marsh village, five acres in extent. At Glastonbury is said to have been situated the first English Christian church, a little wattled building erected by Joseph of Arimathea, the leader of the twelve apostles sent by Saint Philip to Christianize Britain. Tradition states that Joseph established himself here owing to his pilgrim's staff, which he planted on Wearyall Hill while he rested, taking root. From it sprang the celebrated 'Glastonbury thorn,' the *Cratægus precor*, which, according to popular superstition, blossomed every Christmas Day. It was fanatically destroyed by a Puritan during the Cromwellian period, but grafts exist which maintain the traditional blossoming. The site of the original tree is marked by a stone, inscribed I'A, Anno D. XXXI. Joseph was succeeded by two missionaries who established a fraternity of anchorites, which the famous Saint Patrick organized under monastic rule three centuries later. Although joined to the land by Saint Michael's Tor, the peninsula was first known by the Celtic name *Ynyswitrin*, 'isle of the glassy water,' and later as *Ynys yr Avalon*, 'isle of Avalon,' or 'of Apples.' It is the Avalonian burial-place of King Arthur and Queen Guinevere. The modern name is a corruption of Glæstingaburgh. A legend relates that in the long quest of a lost sow a Glæsting was led to an apple-tree by the old church, where, pleased with the place, he and his family settled; hence Glæstingaburgh—city of the Glæstings.

Reliable history relates that about 546 David Meneva built a new church near the old wicker chapel. Paulinus of York in 630 sought to preserve the old chapel as a sacred relic by incasing it in boards covered with lead. In the eighth century the Saxon King Ine built and endowed a Benedictine monastery, which suffered

during the Danish invasions, but was restored and added to by another famous prelate, Saint Dunstan, a native of Glastonbury and a pupil of the institution, who became abbot in 946. It was the sepulchre of Kings Edmund, Edgar, and Edmund Ironside. During the tumultuous period of the Norman Conquest Glastonbury remained unmolested. From 1120 to 1172 the old buildings were replaced by much finer ones, which were scarcely completed when they, with the wicker church, were destroyed by fire on May 25, 1184. Henry II. immediately ordered a larger abbey and church of superb proportions and architecture to be built, which were finished about a century after his death. The length of the church was 525 feet. During the foundation excavations, the supposed grave of King Arthur was discovered. In 1539, on the refusal of Abbot Whiting to surrender Glastonbury and its treasures, Henry VIII. suppressed and dismantled the abbey, and hanged the abbot on the Tor. His body was quartered, and his head fixed on the abbey gate. He was canonized by the Roman Catholic Church in 1896. The famous old abbey clock is preserved in Wells Cathedral. Consult: Hearne, *History and Antiquities of Glastonbury* (Oxford, 1722); Wakefield, *The Avalonian Guide* (Glastonbury, 1821); Willis, *Architectural History of Glastonbury Abbey* (London, 1866); Freeman, *English Towns and Districts* (London, 1883); Gasquet, "The Last Abbot of Glastonbury," in *Henry VIII. and the English Monasteries* (London, 1888-90).

GLASTONBURY THORN. A hawthorn tree at Glastonbury, England, said to have sprung from the staff of Joseph of Arimathea, which he planted in the ground on his visit to the spot. According to the legend, it blossomed on Christmas Day.

GLATIGNY, glá'té'nyé', ALFRED, or ALBERT (1839-73). A French poet, born at Lillebonne (Seine Inférieure). While still very young he wrote his first play, and at seventeen joined a troupe of strolling actors, and wandered with them over Northern France and into Belgium. He wrote constantly, with all the faults and failings of an improvisator. He was one of the 'Parnassiens,' "the last." Saintsbury calls him, "of the vagabond school of Villon." His works include: *Les vignes folles* (1857); *Les flèches d'or* (1864); *Gilles et pasquins* (1872); *L'illustre Brizacier* (1873); and many songs and epigrams.

GLATZ, gláts (Bohemian *Kladsko*). The capital of a circle and a fortified town in the Prussian Province of Silesia, situated on the Neisse, among the Sudetic Mountains, 58 miles by rail southwest of Breslau (Map: Prussia, G 3). It is commanded by an old citadel, and the right bank of the stream is protected by a strong fort, both fortifications dating from 1743. The old ramparts have been demolished, and fine promenades and streets laid out on their sites. Glatz has a new Rathaus, a municipal theatre, and a gymnasium, originally a Jesuit college founded in 1597. The manufactures consist principally of iron products, machinery, furniture, spirits, cigars, shoes, and brick. Glatz is believed to have been founded by the Bohemians in the tenth century. Population, in 1890, 13,501; in 1900, 14,926.

GLAUBER, glou'bér, JAN, called POLYDOR (1642-1726). A Dutch landscape painter and etcher, born at Utrecht, pupil of Berchem at Haarlem, then in Paris (1671) of Picard, and for two years at Lyons of A. van der Kabel. Having gone to Rome, he was much influenced there by Gaspard Poussin, worked afterwards in Padua and Venice, and in 1680 went to Hamburg, residing there and in Copenhagen until 1685, when he settled in Amsterdam, living in the house of Gerard de Lairese, who painted the figures in his landscapes. These are kindred in conception and coloring to those of G. Poussin, often surpassing his model, and are to be found in the Louvre and all the principal galleries of Europe. Of his etchings, the best are a series of twelve plates, two after Poussin, and six others published under the title "La grande Chartreuse."

GLAUBER, JOHANN RUDOLF (1604-68). A German chemist and physician, born at Karlstadt, in Franconia. No details regarding his life are known except that he resided for a long time at Salzburg, then at Kitzingen, then at Frankfort-on-the-Main, then at Cologne, from whence he removed to Amsterdam in 1648. A complete edition of his works, in seven volumes, appeared at Amsterdam in 1661. An English translation by Parke, in one large folio volume, was published in London in 1689. Glauber improved many industrial processes, and discovered the medicinal properties of numerous substances. His name at the present day is chiefly known for his discovery of sulphate of soda, which he termed *sal mirabile*, and regarded as a universal medicine and a cure for all diseases. See CHEMISTRY.

GLAUBER'S SALT, or SODIUM SULPHATE, Na_2SO_4 . When crystallized with water, it has the formula $\text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O}$. It is found native as *mirabilite* or *sal mirabile* at various places in Austria, Italy, and Spain, and in the United States in large quantities at Great Salt Lake, Utah. It is also a constituent of mineral waters, and exists in small quantities in the blood and other animal fluids. It was originally prepared by Glauber in 1658, by decomposing sodium chloride (common salt) with sulphuric acid. Formerly it was a by-product in the manufacture of hydrochloric acid from common salt and sulphuric acid, and in the manufacture of common salt. At present it is obtained mainly as a by-product ('salt cake') in the manufacture of soda-ash. Glauber's salt is a white crystalline compound, with a bitter saline taste. When exposed to the air its crystals effloresce, losing most of their water of crystallization, and becoming a white powder. Its chief use is as a purgative in medicine, and as such it is largely used in veterinary practice; but it is also largely employed in the production of certain kinds of glass, and in fixing lead mordants in dyeing and printing. See SODA.

GLAUCHAU, glou'kou. A manufacturing town in Saxony, Germany, situated on the Mulde, eight miles north-northeast of Zwickau (Map: Germany, E 3). It contains two old churches, dating from the twelfth and the sixteenth century respectively; two castles; and a new Rathaus. Among its numerous educational institutions the most prominent is the school of weaving, with a good collection of old textiles. Glauchau is one of the centres of the German

textile industry, producing principally woolen and half-woolen goods. There are also manufactured machinery, timber, and brick. Glaucho is the birthplace of the famous mineralogist Georg Agricola. Population, in 1890, 23,405; in 1900, 25,677.

GLAUCOMA (Lat., from Gk. *γλαύκωμα*, opacity of the crystalline lens, from *γλαυκός*, *glaukos*, bluish-green; so called from the appearance of the eye in this disease). An important disease of the eye, characterized by increased intraocular tension. In addition to primary and secondary glaucoma, a congenital glaucoma is described. According to the rapidity of onset and the severity of the disease, primary glaucoma is divided into inflammatory or congestive, and non-inflammatory or simple. The inflammatory type may be acute or chronic. The cause of glaucoma is unknown. The disease has been observed chiefly in old persons, particularly in women, and usually involves the eyes successively. Jews seem predisposed to it. Heredity, gouty and rheumatic diatheses, cardiac and arterial disease, and chronic constipation seem to exert an influence. Persons with hyperopia (see SIGHT, DEFECTS OF) are often afflicted with glaucoma; those with myopic eyes, very rarely. Various forms of excitement, eye-strain, improper use of atropine, and other causes of venous congestion of the eyes are mentioned as exciting factors. The essential feature of the disease is the increase of pressure within the eye, the present view being that there is undue retention of fluids within the eye. Acute inflammatory glaucoma may begin with a prodromal stage, in which sight is somewhat obscured by œdema of the cornea, with some dilatation of the pupil and increased tension in the eyeball. A number of these attacks, each followed by increased presbyopia (see SIGHT, DEFECTS OF), are succeeded by the stage of active glaucoma. This is marked by sudden failure of vision, with great pain in the eye, and headache. There is marked increase of tension, cloudiness and insensibility of the cornea; the pupil is oval, fixedly dilated, and often greenish; the iris is dull and changed in color. The conjunctiva is congested, including the space around the cornea. The interior of the eye is cloudy. Recovery takes place with practically a persistence of all these appearances in a slight degree, and from time to time other attacks occur, the eye being left in worse condition after each. Finally the stage of absolute glaucoma is reached: blindness, increase of the changes in appearance noted in the early attacks, increased tension, and in some cases pain at intervals. Degeneration of the eyeball may follow. Cases of unusual severity, resulting in blindness within a few hours, are known as *glaucoma fulminans*. Chronic inflammatory glaucoma differs from the acute only in the mildness of its initial symptoms and the slowness of its course, the final result being the same. *Simple glaucoma* is a very slowly progressing type, with no active symptoms of inflammation, simply the increased tension and gradual failure of vision. *Secondary glaucoma* is an increase of tension, with other symptoms of glaucoma, secondary to other disease of the eye or to injury. *Congenital glaucoma* usually affects both eyes, leading to blindness. In the treatment of glaucoma atropine must never be employed. Eserine

and pilocarpine, locally, may give some relief. Iridectomy, an excision of part of the iris, is the most effectual treatment. Sclerotomy, an incision through the sclera or white of the eye, is sometimes employed in its place.

GLAUCONITE, *gl'kô-nīt* (from Gk. *γλαυκός*, *glaukos*, bluish-green), or GREEN EARTH. An iron potassium hydrous silicate. It is found either amorphous in cavities of rocks, or in a loosely granular condition. In color it is of various shades of green, and is found in Russia, in Belgium, and in various localities in New Jersey and Mississippi in the United States.

GLAUCOPHANE, *gl'kô-phān* (from Gk. *γλαυκός*, *glaukos*, bluish-green + *φαίνειν*, *phainein*, to appear). A mineral belonging to the amphibole group and crystallizing in the monoclinic system. It is a silicate of sodium, aluminum, iron, and magnesium. The mineral has a vitreous to pearly lustre, and is found in various shades of blue. It is a constituent of various crystalline schists, gneisses, and other rocks. It occurs associated with diallage, epidote, mica, garnet, etc., at various points along the Alps in Switzerland, and in Italy; while in the United States it is found on the coast ranges of California. According to Dana, it has been noted as a secondary product due to the alteration of diallage by a process of 'glaucophanization.'

GLAUCUS (Lat., from Gk. *Γλαῦκος*, *Glaukos*). A Lycian prince, who, along with Sarpedon, assisted Priam in the Trojan War. He was the son of Hippolochus, and grandson of Bellerophon, mythical progenitor of the kings of Lycia. When Glaucus and Diomedes met in battle they discovered their houses were joined in hereditary friendship, whereupon they exchanged weapons, Glaucus giving his golden armor for the bronze of Diomedes (*Iliad*, vi.). The incident became proverbial for an unequal exchange. Later writers say that he was afterwards slain by Ajax; but his body was carried back to Lycia, as that of his brother had been.

GLAUCUS. An artist of Chios, said to have invented the art of soldering iron. His most famous work was a silver vase resting on an iron base, curiously decorated and wrought in his new technique, which was dedicated about B.C. 605 by Alyattes II. of Lydia to Apollo at Delphi.

GLAUCUS. Son of Minos, King of Crete, and Pasiphaë. On one occasion when a child, while playing at ball, or, according to another account, chasing a mouse, he fell into a pot of honey and was smothered. His father, after a long and vain search, consulted the oracle and was told that the person who could suggest the aptest comparison for one of his own cows, which had the power of assuming every day three colors, would restore his son alive. Polyidus, the seer of Argos, who likened the animal to the mulberry and the bramble, was ordered by Minos to find the child and restore it to life. The latter injunction Polyidus was unable to perform, and he was therefore sentenced to be entombed alive with the corpse. Seeing in the tomb a serpent bring back to life its dead companion by laying upon it the leaves of a certain herb, Polyidus conceived the idea of treating the dead boy in the same way. The process proved successful. Then Minos ordered the seer to teach the child the art of prophecy. This also Polyidus did, but imme-

diately deprived him again of all remembrance of his instruction. Consult: Höck, *Kreta* (Göttingen, 1829); Roscher, *Nektar und Ambrosia* (Leipzig, 1883); Gädechens, in Roscher's *Lexikon* (Leipzig, 1884 et seq.).

GLAUCUS, PONTIUS. According to the legend, a fisherman of Anthedon. Through the influence of a magic herb he was changed into a sea-god and gifted with unerring prophecy. He is found especially in connection with Nereus and his train, and was worshiped not only at Anthedon, but on many islands and coasts, as at Delos, Naxos, Corinth. He was especially honored by sailors and fishermen, and is often represented in art as wearing a fish-basket on his head. In the legends he appears as prophesying to the Argonauts, and his unrequited loves for Scylla and Ariadne were frequent themes among the later poets. Consult Gädechens, *Glaukos der Meergott* (Göttingen, 1800).

GLAUCUS, POTNIEUS. A son of Sisyphus by Merope, and the father of Bellerophon. According to the legend he was destroyed by his own mares, the most common form of the story being that he was torn to pieces by them. Accounts differ as to the place of his violent death, and also as to the immediate occasion of it. Sometimes it is represented as having happened at Iolous, at the funeral games of Pelias, but usually the scene is laid at Potniæ. He is most frequently represented as having offended Aphrodite by having kept his mares from breeding; but other versions of the myth are that he had fed them on human flesh to make them more spirited, or that they had been suffered to drink at a sacred well at Bæotia, or that they had eaten the herb hippomanes. He was the subject of a lost tragedy of Æschylus. In Corinth this legend is confused with that of Glaucus Pontius (see above), and the same stories are told of both. In fact, it is very probable that the Corinthian Glaucus is only a local variation of the commonly worshiped divinity. Some mythologists (comparing the Greek phrase γλαυκὴ θαλασσα) see in Glaucus the quiet gleaming sea, whose calm surface is destroyed by the violent risings of the waves, the horses of Poseidon.

GLAUCUS. The hero of Bulwer's novel *The Last Days of Pompeii*; a Roman noble, dwelling in Pompeii, and the protector of Nydia, a blind flower-girl, who loves him in secret. He combines luxury, philosophy, and ennui.

GLAZE. See POTTERY.

GLAZE'BROOK, RICHARD TETLEY (1854—). An English physicist. He was born at West Derby, Liverpool, September 18, 1854, and was educated at Liverpool College and Trinity College, Cambridge, where he graduated with honors in 1876 and was made a fellow in the following year. In 1880 he was appointed demonstrator in physics at the Cavendish Laboratory, and ten years later was made assistant director. He was also university lecturer in mathematics at Cambridge, and in 1898 and 1899 was principal of University College, Liverpool. In the latter year he was made director of the National Physical Laboratory, a position he has since held. Among his more important researches are those dealing with the absolute resistance of the British Association unit and the specific resistance of mercury, a dynamical treatment of the theory of

double refraction, a verification of Fresnel's theory of double refraction in a biaxial crystal, and other investigations dealing mainly with optics and electricity. He is the author, with W. N. Shaw, of an excellent *Text-Book of Practical Physics* (1884), and of a *Text-book of Physical Optics* (1882); *Laws and Properties of Matter* (1893); *Clerk-Maxwell and Modern Physics* (1896); and various scientific text-books.

GLAZIER, glä'zhër, WILLARD (1841-1901). An American soldier, author, and explorer. He was born at Fowler, N. Y., was educated at Gouverneur Seminary and at the Albany Normal School. He taught school from 1859 to 1861, when he enlisted in the Second New York Cavalry. In 1863 he was taken prisoner by the Confederates in Virginia and confined in Libby Prison, Richmond, and at Columbia, S. C. His escape to the Union lines was the subject of his first book, *Capture, Prison-Pen and Escape* (1865), of which more than 400,000 copies were sold. He also wrote: *Three Years in the Federal Cavalry* (1870); *Battles for the Union* (1874); *Heroes of Three Years* (1878); *Peculiarities of American Cities* (1873); and *Down the Great River* (1887), the latter being an account of a trip to the sources of the Mississippi River. Consult his life by Owens, *Sword and Pen* (Philadelphia, 1884).

GLAZUNOFF, glä'zŭ-nôff', ALEXANDER (1865—). A Russian composer. He was born at Saint Petersburg, and studied first at the Polytechnic Institute. Conscious of his gift for music, and with the advice of many musical friends and teachers in sympathy with his aims, he determined to devote himself entirely to music. His most important teacher was Rimsky-Korsakoff, who was friend as well as teacher. His first symphony was produced when he was but sixteen years of age, and the second three years later, under the auspices of Liszt at Weimar. Paris accorded him a most enthusiastic reception when in 1889 he visited there and conducted in person his second symphony and many minor compositions. He visited London afterwards, and conducted his fourth symphony at a concert of the London Philharmonic Society. He has been accepted in his own country as a representative Russian composer, and in 1896-97, together with Liadoff and Rimsky-Korsakoff, conducted the national Russian symphony concerts at Saint Petersburg. He belongs to the school of Tchaikovsky in the national sense, and, like him, is occasionally prodigal in brilliant orchestral effects. His concert waltzes for orchestra have been great favorites in America, and have been played frequently by the Thomas orchestra. Besides his orchestral compositions there are many smaller instrumental works to his credit, for he is one of the most prolific composers of the present time.

GLEASON, FREDERICK GRANT (1848-1903). An American composer, born at Middletown, Conn. He was a pupil of Dudley Buck, and in 1869 went to Germany, where he studied in the Leipzig Conservatory, and later in Berlin and London. In 1875 he returned to the United States, becoming church organist in Hartford and New Britain, Conn., and, in 1877, teacher in the Hershey School of Music, Chicago. Mr. Gleason was elected a fellow of the American College of Musicians, president of the Chicago Musical Society,

and president-general of the American Patriotic Musical League. He composed two grand operas, *Otho Visconti* and *Montezuma*, and numerous songs and instrumental pieces.

GLE/BA (Lat., *clod*). A chambered form of fructification found in the puffballs and their allies. See **BASIDIOMYCETES**.

GLEBE (Lat. *gleba*, *clod*). The land possessed as part of an ecclesiastical benefice, or from which the revenues of the benefice arise. The assignment of glebe lands was formerly held to be of such absolute necessity that without them no church could be regularly consecrated. The fee simple of the glebe is held by the law of England to be in *abeyance*; that is to say, it is only "in the remembrance, expectation, and indentment of the law"; but after induction, the freehold of the glebe is in the parson, and he possesses most of the powers of a proprietor, with the exception of the power of alienation. Previous to the Reformation the clergy possessed certain powers of alienation at common law; and if a bishop, with the assent of his chapter, or an abbot, with the assent of his convent, or the like, alienated glebe lands, the deed would not have been void, because the fee simple was in the holder of the benefice for the time being; but by 1 Eliz., c. 19, and 13 Eliz., c. 10, it was provided that all gifts, grants, feoffments, conveyances, or other estates made of glebe lands should be utterly void and of none effect. Neither could the incumbent exchange the lands or any portion of them without the authority of an act of Parliament. This restriction was done away by 55 Geo. III., c. 147, for enabling spiritual persons to exchange parsonage or glebe houses or glebe lands for others of greater value or more conveniently situated for their residence and occupation. By 5 and 6 Vict., c. 54, it is now provided that the commissioners appointed to carry into effect the commutation of tithes shall have power to ascertain and define the boundaries of the glebe lands of any benefice, and also power, with consent of the ordinary and patron, to exchange the glebe lands for other lands within the same or any adjoining parish, or otherwise conveniently situated.

In Scotland, as in England, a glebe forms, as a general rule, a portion of every ecclesiastical benefice of the Established Church, and is thus an addition to the stipend, and sometimes a very important one. As in England, the alienation of glebe lands by the incumbent of the parish has from a very early period been forbidden. (Stat. 1572, c. 48.) Consult Phillimore, *Ecclesiastical Laws of the Church of England* (2d ed., London, 1895).

GLEDE. A bird. See **KITE**.

GLEDITSCH, glä'dich, JOHANN GOTTLIEB (1714-86). A German botanist and writer on forestry. He was born and educated at Leipzig. After lecturing on botany and materia medica at Frankfurt-on-the-Oder for four years, he was appointed professor of botany at Berlin, and director of the Botanical Garden in that city. It was, however, in his capacity as professor of forestry at the Berlin academy devoted to that science that he exercised that permanent influence which induced Linnæus to name the species *Gleditschia* after him. His chief publication is *Systematische Einleitung in die neuere aus ihren*

eigenbümlichen physikalisch-ökonomischen Gründen hergeleitete Forstwissenschaft (1775).

GLEDIT'SCHIA. See **HONEY LOCUST**.

GLEE (AS. *glfo*, mirth, music, leel. *glŷ*, merriment). The English name of a vocal composition for three or more voices, and in one or more movements. The style of music of the glee is peculiar to England, and quite different from the part songs of Germany, being more extended and laying emphasis on variety rather than unity. The first glees were written by Arne and Boyce about the middle of the eighteenth century. The great composer of glees was S. Webbe, who died in London in 1816. Excellent examples of glees are Stevens's "Blow, blow, thou winter wind," and Webbe's "Swiftly from the mountain's brow."

GLEET. See **GONORRHEEA**.

GLEGG, Mrs. The aunt of Maggie Tulliver, in George Eliot's *Mill on the Floss*; a bigoted, carping creature.

GLEICHENBERG, glīk'en-bĕrk. A watering-place of Styria, Austria, 1020 feet above sea-level, in a charming, picturesque valley surrounded on three sides by mountains, about 40 miles southeast of Gratz (Map: Austria, D 3). It is well known for its non-chalybeate saline alkali springs, which are much frequented by sufferers from pulmonary complaints. Large quantities of the water are exported. There are several beautiful châteaux and parks of the Austrian nobility in the vicinity. Resident population, about 800.

GLEICHEN-RUSSWURM, glīk'en-rus'vurm, LUDWIG, Baron von (1836-1901). A German landscape painter, born at Castle Greifenstein, Bavaria, pupil of Max Schmidt and Hagen at the School of Art in Weimar. Given to realistic treatment from the first, his style of painting afterwards approached closely that of the impressionists, as may be seen, respectively, from "An Idyl" (1885), in the National Gallery, Berlin, and an "Evening Landscape" (1892), in the Weimar Museum. Both these galleries have also collections of his water-colors. He was the grandson of Schiller.

GLEIG, glĕg, GEORGE (1753-1840). A Scottish divine, Bishop of Brechin, and primus of the Episcopal Church of Scotland. He was born on a farm at Boghall, Kincardineshire, and was educated at King's College, Aberdeen, where he took honors in mathematics and physical science. He was ordained in the Scotch Episcopal Church in 1773, and took charge of a congregation at Pitmenweem, Fifeshire, removing thence to Stirling in 1787. He became a frequent contributor to the *Monthly Review*, the *Gentleman's Magazine*, and other publications, and wrote extensively for the third edition of the *Encyclopædia Britannica*, of which, after the death of Colin Macfarquhar, the editor, in 1793, he edited the last six volumes. He was thrice elected Bishop of Dunkeld, but through the opposition of Bishop Skinner, the primus of the Scotch Church, whose hostility he had aroused by criticism of one of his sermons in the *Gentleman's Magazine*, his elections were rendered ineffectual. In 1808, however, having acceded to the tests imposed by Bishop Skinner, he was chosen successor to Bishop Strohan in the Bishopric of Brechin, succeeding in 1810. He bent his efforts toward securing a strict ad-

herence to the English liturgy, with the single exception of the communion, and in this he was eminently successful. In 1816 he was elected primus of the Church of Scotland, and set himself to extending the reforms begun in his own episcopate, and cementing the alliance with the English Church. In this he was not altogether successful, owing to his persistent interference in diocesan elections, by which he alienated some of his strongest supporters. He resigned the primacy in 1837. In addition to several volumes of sermons, he published *The Life and Writings of William Robertson* (1812), and *Directions for the Study of Theology* (1837). He edited Stackhouse's *History of the Bible* (1817). Consult Walker, *Life of the Right Reverend John Gleig, Bishop of Brechin* (Edinburgh, 1878).

GLEIG, GEORGE ROBERT (1796-1888). A Scottish writer, born at Stirling, and the son of George Gleig, Bishop of Brechin. In 1812, while a student at Oxford, he joined, as a volunteer, a regiment then on its way to London, and served in the Peninsular campaign. During the American War of 1812-14 he participated in the movement against the city of Washington, and was severely wounded in the battle of Bladensburg. In 1821 he published an account of the *Campaigns of the British Army at Washington and New Orleans*. After the war he entered holy orders, and was presented to the living of Ivy Church, Kent. In 1825 he published *The Subaltern*, a novel founded on his experience in the Peninsular War, written in an entertaining style and showing considerable literary skill. In 1844 he was appointed chaplain-general of the forces, and having devised a scheme for the education of soldiers, was later appointed inspector-general of military schools. Gleig wrote a great variety of biographical, historical, and religious books. The most interesting is his *Life of the Duke of Wellington* (1862). His *Life of Warren Hastings* (1841) served as the text of Macaulay's *Essay on Warren Hastings*.

GLEIM, glīm, JOHANN WILHELM LUDWIG (1719-1803). A German poet whom the glories of Frederick II.'s struggle in the Seven Years' War inspired to write the vigorous and thrilling *Lieder eines preussischen Grenadiers* (1758). Gleim was born at Ermsleben, near Halberstadt, and was the most prominent of the early political song writers of Germany. His other songs, fables, romances, classical and mediæval imitations, are as unimportant as his didactic epic *Halladat* (1774), being at their best feebly pretty and at their worst very dull. He died at Halberstadt. Gleim's *Works* are in 7 vols. (1811-13). For his *Life*, consult Körte (Halberstadt, 1811).

GLEIWITZ, glī'vīts. A town in the southeastern part of the Prussian Province of Silesia, situated on the Klodnitz and the Klodnitz Canal, 100 miles by rail southeast of Breslau (Map: Prussia, H 3). It is a manufacturing place of considerable importance, containing many extensive foundries, machine-works, wire and wire-nail mills, glass-works, paper and saw mills, etc. Gleiwitz dates from the twelfth century. Population, in 1890, 19,667; in 1900, 52,362, mostly Roman Catholics.

GLENARVON. Lady Caroline Lamb's first novel, published anonymously in London in 1816. Its caricature of Byron, with whom the author

had had a short love affair and a quarrel, soon made the book famous. It was reprinted in 1865.

GLENCOE, glēn-kō'. A deep, precipitous valley, in northern Argyllshire, Scotland. It is about eight miles in length, and is divided into an upper and a lower valley. It is famous for the wildness and sublimity of its scenery, and for the massacre of Glencoe. The Highlanders, faithful to the old dynasty, were promised full pardon if on or before December 31, 1691, they submitted to the rule of William III. and Mary. The surrender of Mac Ian, chief of the Macdonalds of Glencoe, from unforeseen causes was delayed till January 6th. His enemies, headed by Sir John Dalrymple, Master of Stair, suppressed the certificate of submission, and took advantage of the technical irregularity to obtain a warrant from the King for their extirpation. Under the guise of friends, 120 men, mostly Campbells and hereditary foes, led by Captain Campbell of Glenlyon, accepted the hospitality of the Macdonalds for twelve days, then treacherously attacked them at five o'clock in the morning of February 13, 1692. Thirty-eight persons, including children and women, were slain. About three hundred men and women escaped in a violent storm, but many perished from cold and hunger in the snow of the mountain gorges. Consult Macaulay, *History of England*.

GLENCOE. A village and the county-seat of McLeod County, Minn., 51 miles west by south of Minneapolis; on the Chicago, Milwaukee and Saint Paul Railroad (Map: Minnesota, D 6). It is surrounded by a farming region, and has grain-elevators, flour-mills, lumber-mills, etc. Stevens Seminary and Saint Joseph's Academy are here. Population, in 1890, 1649; in 1900, 1780.

GLENCOE, OR THE FALL OF THE McDONALDS. A drama by Sir Thomas Talfourd, produced in 1840 by Macready and preferred by him to the author's more famous *Ion* in its dramatic construction.

GLENCORSE, LORD. See INGLIS, JOHN, Lord GLENCORSE.

GLENDALE, BATTLE OF. See FRAZIER'S FARM, BATTLE OF.

GLENDIN'ING, EDWARD and HALBERT. Two brothers, important characters in Scott's *Monastery* and its sequel, *The Abbot*. The latter, the elder, becomes the Knight of Avenel in the second work.

GLEN'DIVE. The county-seat of Dawson County, Mont., 78 miles northeast of Miles City; on the Yellowstone River, and on the Northern Pacific Railroad (Map: Montana, G 2). It has railroad repair shops, and carries on an important trade in live stock and wool. Extensive deposits of lignite are found in the adjacent region. Population, about 1200.

GLEN DOWER, glēn'dōor, OWEN (1359?-1416?). A Welsh chief, claiming descent from Llewellyn, and prominent as an opponent of the English during the reign of Henry IV. At first he was a follower of Henry of Lancaster, who succeeded Richard II. in 1399, but local troubles forced him into opposition. The Welsh were strongly attached to Richard II., and, moved by rumors that Richard was still alive, rose in revolt against Henry (1400). Glendower led this movement, and was at first very successful. The King ordered his subjugation, and granted his

estates to the Earl of Somerset. Though Glendower's forces were inferior in number to those of his adversaries, he was sometimes victorious, chiefly through surprise, ambushes, and the like. Often, however, he was defeated and forced to retire to the hills. In 1402 he drew Lord Grey into an ambush and took him prisoner. A few weeks later Sir Edmund Mortimer, the uncle of the Earl of March, was captured by Glendower, after a battle won by the latter. Treason seems to have been falsely imputed to Mortimer as the cause of his defeat; but Henry IV.'s suspicions and Glendower's kindness soon made the treason sufficiently real, for Mortimer married one of Glendower's daughters and conspired with him against the English King. In July, 1404, Glendower entered into a treaty with Charles VI. of France against the English. Little came of it, for in the following year Glendower sustained severe reverses. For two or three years more his fortunes were somewhat in the ascendant, and then they sank to the ordinary level of the petty warfare of a barbarous mountain chief. On February 24, 1416, Glendower was still alive, but nothing is known about him after that date. His successes show that he had about the highest talents of his class, and he had their faults also. The popular idea of him is to be found in Shakespeare's *King Henry IV.* From the first he has been a kind of mythical hero, and the lapse of centuries does not clear up the exact facts of his history. He was the last champion of Welsh independence which the English kings had been steadily stamping out for nearly a century and a half. Consult Wylie, *History of Henry IV.* (London, 1881-94).

GLENELG'. A shallow river, 280 miles long, rising in the southwestern part of Victoria (Map: Victoria, A 4). After crossing the boundary into South Australia and receiving all the rivers southwest of the Grampian Mountains it enters the Southern Ocean between Cape Northumberland on the west and Cape Bridgewater on the east. In the rainy season it is subject to heavy floods.

GLENGARRY. A beautiful valley or glen in West Inverness-shire, Scotland, about eight miles southwest of Fort Augustus (Map: Scotland, C 2). It takes its name from the Garry River, which takes a winding course through it for some nineteen miles. This valley was the home of the Macdonnells from the beginning of the sixteenth century until the death of the last of the acknowledged chief's family in the early part of the nineteenth century. Scott is said to have taken the last chief of this family, Col. Alexander Ranaldson Macdonell, as his model for Fergus MacIvor in *Waverley*. The Glengarry cap was named from this valley.

GLENROY'. A narrow, rocky glen of Inverness-shire, Scotland, through which flows the Roy. After a course of about 15 miles this stream joins the Spean at Keppoch (Map: Scotland, D 3). The glen is remarkable for three terraced shelves, running round it, everywhere horizontal and parallel to each other, and known as the 'parallel roads of Glenroy.' The highest is about 1150 feet above sea-level. The second is 80 feet lower; the third lies about 855 feet above sea-level, and may be traced round the mountain of the glen into the valley of the Spean. The subject of much scientific study and discussion, they

are now conceded to be ancient water margins, the shore-lines of fresh-water lakes, which gradually washed away the ice barriers of a glacial period.

GLENS FALLS. A village in Warren County, N. Y., 56 miles north of Troy; on the Hudson River and on the Delaware and Hudson Canal Company's Railroad (Map: New York, G 2). It derives its name from the falls in the Hudson, which supply exceptional power for manufacturing; and the island below the falls is associated with Cooper's *Last of the Mohicans*. There are large quarries of black marble and limestone, extensive lime-works, Portland-cement works, a number of saw-mills and planing-mills, and manufactures of paper, shirts, collars, plaster, lath, etc. The village has the Crandall Free Library, a State armory, Saint Mary's and Glens Falls academies, an old ladies' home, the Parks Hospital, McGregor and Crandall parks, and a great iron bridge just below the falls. The government is administered under general laws of 1870, the village having been reincorporated in 1872, by a village president and a board of trustees, which elects most of the subordinate officials. Town meetings are held every two years, and the charter election annually. The village owns and operates its water-works. Glens Falls was settled in 1763 and incorporated in 1837. In 1864 it was almost completely destroyed by fire, and again in 1884 was visited with a similar disaster, which necessitated the rebuilding of the southern part of the village. Population, in 1890, 9509; in 1900, 12,613.

GLENVILLE. A village in Cuyahoga County, Ohio, five miles from Cleveland; on the Lake Shore and Michigan Southern Railroad (Map: Ohio, G 2). It is primarily a residential suburb of Cleveland, and is just east of Gordon Park, a part of that city's public park system. The principal industrial establishment is a chair-factory. Settled in 1804, Glenville was incorporated in 1872. The government is administered under a charter of 1878, which provides for a biennially elected mayor and a village council. Population, in 1900, 5588.

GLENWOOD. A city and the county-seat of Mills County, Iowa, 20 miles south by east of Council Bluffs; on the Chicago, Burlington and Quincy Railroad (Map: Iowa, B 4). It is the seat of the State Institution for Feeble-Minded Children. The city, besides being the centre of important corn and live stock interests, is in a highly productive fruit-growing country, and has an extensive canning factory. The water-works are owned by the municipality. Population, in 1890, 1890; in 1900, 3040.

GLENWOOD SPRINGS. A town and the county-seat of Garfield County, Colo., 123 miles west of Denver; on the Grand River and on the Denver and Rio Grande Railroad (Map: Colorado, D 2). It is in a cattle-raising, coal and iron mining, fruit-growing, and general farming region, and is widely known as a health resort. Among its attractions are numerous hot springs, an open-air swimming-pool which affords bathing in winter as well as in summer, and superb mountain scenery. Population, in 1890, 920; in 1900, 1350.

GLEYSRE, glär, CHARLES (1806-74). A French painter, born at Chevilly in Canton Vaud, Switzerland. At the age of eighteen he

went to Paris and worked under Hersent. Later he studied the works of the masters in Italy and traveled extensively in the Orient, sketching land and people after nature. His first work at the Salon appeared in 1840, but he did not obtain marked success until in 1843 he exhibited "Evening," also called "Lost Illusions," now in the Walters Gallery, Baltimore. Among his other works are the "Departure of the Apostles" (1845); "Pentecost," in Sainte Marguerite, Paris; the "Execution of Major Duval," and the "Battle of Leman," in the Lausanne Museum; "Pentheus Pursued by Mænads," and the "Charmer," in the Basel Museum. Gleyre's genius was refined and sensitive, and his works were executed with conscientious frankness and sincerity. Among his pupils were many men afterwards well known in the world of art. Gleyre died suddenly, May 5, 1874, while visiting the Alsace-Lorraine exhibition at the Palais Bourbon. For his biography, consult: Clement (Paris, 1885); Berthond (Lausanne, 1880); Mantz, in *Gazette des Beaux-Arts* (Paris, 1875); and Cook, *Art and Artists of Our Time*, vol. i. (New York, 1888).

GLID'DON, GEORGE ROBINS (1809-57). An English archaeologist, Egyptologist, and ethnologist, born in Devonshire. When very young he was taken to Egypt by his father, who was a merchant residing at Alexandria and also United States consul. During Gliddon's long residence in Egypt, in the course of which he served for some time as United States vice-consul, he devoted much time to the study of Egyptian antiquities. Later he came to America and lectured on this subject in Boston, New York, and Philadelphia. His lectures did much to attract popular interest to Egyptology and its results. At the time of his death in Panama he was agent for the Honduras interoceanic railway. He wrote: *A Memoir on the Cotton of Egypt* (1841); *An Appeal to the Antiquaries of Europe on the Destruction of the Monuments of Egypt* (1841); *Discourses on Egyptian Archaeology* (1841); *Ancient Egypt* (1850; new edition, 1853); *Types of Mankind*, written in conjunction with Dr. J. C. Nott and containing contributions from Agassiz, Dr. Samuel G. Morton, and others (1854); *Indigenous Races of the Earth*, also written in conjunction with Dr. Nott and containing contributions from Alfred Maury, librarian of the French Institute; Francis Pulszky, the Hungarian ethnologist; and Professor Meigs, of Philadelphia (1857).

GLINKA, glĕŋ'kă, FEODOR NIKOLAYEVITCH (1788-1880). A Russian soldier and man of letters. He was born at Smolensk, in 1788, and was educated for the army. In 1803 he became an officer, and in 1805 fought at Austerlitz. At the close of the campaign he left the service, and devoted himself to study and travel about Russia. Upon the invasion of the French in 1812 he reentered the Russian Army, and remained in active service until the end of the campaign in 1814. When Count Milarodovitch became Military Governor of Saint Petersburg, Glinka was appointed colonel under his command. In 1826, on account of his alleged connection with a political conspiracy, he was banished to Petrozavodsk. After some time he was pardoned, and again took up his residence at Saint Petersburg, and became Councilor of State. He wrote: *Let-*

ters of a Russian Officer in the Campaigns of 1805-06 (1815-16; 2d ed. 1870); a poetical translation of the Psalms, of the Prophets, and of the Book of Job; *Reminiscences of the Year 1812*; and a poem, "Kareliya."

GLINKA, MIKHAIL IVANOVITCH (1804-57). A celebrated Russian composer of the early modern school. He was born at Mikhail, near Smolensk, of aristocratic parents, and consequently received the education of a young noble of the period. His earlier musical teachers were Böhm (violin), Carl Mayer (theory and pianoforte), and later Field; subsequently he spent four years in Italy, ostensibly for his health, but practically completing his musical education. After studying for a little while with Dehn, of Berlin (1834), he was led to attempt composition, the result being the first Russian national opera, *A Life for the Czar* (1836), which received its first performance at Saint Petersburg. While the musical treatment of the opera on the whole is Italian to a degree, it is occasionally very Russian in its coloring, which, together with its purely Russian plot, has earned for its composer the reputation of being the pioneer of the modern Russian school, and the forerunner of the famous national composer Tchaikovsky. His success gained for him the appointment of Imperial chapelmaster and conductor of the opera at Saint Petersburg. The second opera, first presented at Saint Petersburg in 1842, was arranged from a poem of the Russian poet Pushkin, and was entitled *Ruslan and Ludmilla*. In character it is very similar to the first one, and was almost as great a popular success. In 1844 he visited Paris, and gave a series of orchestral concerts. His other works include compositions for the pianoforte, on which instrument he was a brilliant performer, symphonies, orchestral suites, and numerous songs and romances, the latter clearly indicating the influence of Field. He died at Berlin, while on a visit to his old teacher, Dehn. Consult Cui, "La musique en Russie," in *Revue et Gazette Musicale de Paris* (Paris, 1878-79).

GLINKA, SERGEYEVITCH NIKOLAI (1774-1847). A Russian author, brother of Feodor. He was born in the Government of Smolensk, and lived principally at Moscow, where he devoted himself to literary work, and founded the anti-French periodical *Russkoye Vestnik*. His contributions to juvenile literature include *Russian History for Young People* (3d ed. 1824) and *Reading for Children* (1821). Glinka was a very prolific author; he is said to have written more than fifty works. During the last twenty years of his life he was a censor at Moscow.

GLIOMA (Neo-Lat., from Gk. γλία, *glia*, glue). A tumor arising from the delicate connective tissue which holds together the nerve substance, either of the brain or of other parts, and which has a gummy or glutinous consistency. Its usual seat is the brain or orbit. See TUMOR.

GLIS'AN, RODNEY (1827—). An American physician. He was born at Linganore, Md., and was educated at the University of Maryland. As assistant surgeon of the United States Army, he served for eleven years as medical officer (1850-61) in the West, and ultimately settled at Portland, Ore. His publications include the following: *Journal of Army Life* (1874); *Text-Book*

of *Modern Midwifery* (1881); and *Two Years in Europe* (1887).

GLISSON, glis'son. FRANCIS (1597-1677). An English physiologist, born at Rampisham, Dorsetshire, and educated at Cambridge and Oxford. He became professor of physics at the former university in 1636, and retained that position until his death. In 1639 he also received an appointment as lecturer on anatomy in all its branches at the College of Physicians, London, of which he was president from 1667 to 1669. He was one of the founders of the Royal Society, and was distinguished alike as an investigator, lecturer, and author. Especially noteworthy were his investigations on the morbid anatomy of rickets, as treated in his famous work entitled *De Rachitide sive morbo puerili qui vulgo The Rickets dicitur, Tractatus* (1650), frequently reprinted and translated into English. His work on the liver and its diseases, entitled *Anatomia Hepatis* (1654), is also important, the term 'Glisson's capsule,' now a part of medical phraseology, perpetuating the name of its author.

GLISSON, OLIVER S. (1809-90). An American naval officer, born in Ohio. He entered the navy as a midshipman in 1826; commanded the schooner *Reefer* during the Mexican War, and accompanied Commodore Perry on his expedition to Japan in 1853-55. In the Civil War he commanded successively the *Mount Vernon* and the *Mohican*, and in the attacks of December, 1864, and January, 1865, on Fort Fisher (q.v.), commanded the third division of the attacking fleet. He was promoted to be commodore in July, 1866, and to be rear-admiral in June, 1870, and on January 18, 1871, was retired from the service.

GLOAG, glög, PATON JAMES (1823—). A Scottish clergyman. He was born at Perth, and was educated at the academy in that city, and at the universities of Edinburgh and Saint Andrews. In 1848 he was appointed minister at Dunning, and remained there until 1860, when he accepted a call to the ministry of Blantyre. He was minister of Galashiels from 1871 to 1892, when he removed to Edinburgh. Besides several translations from the German of the works of Lechler, Huther, Lünemann, and Meyer, he published the following works: *Assurance of Salvation* (2d ed. 1869); *Ezegetical Studies* (1884); *Introduction to the Johannine Writings* (1891); *Subjects and Modes of Baptism* (1891); *The Life of Saint John* (1892).

GLOBE (from Lat. *globus*, ball). A term used to denote any round or spherical body (see SPHERE), and often used to signify the earth. 'Globes,' or 'the globes,' generally means a pair of artificial globes used as a part of school-room apparatus. These are usually hollow spheres of cardboard, coated with a composition of whiting, glue, and oil, upon which paper bearing certain delineations is laid. On one of the globes—the *celestial*—are represented the stars, placed in positions corresponding to their actual situation in the sky. If the celestial globe is *oriented* (i.e. set in a position) correctly, a line drawn from its centre to any star marked on its surface will, if produced to the sky, pass through the actual star. On the other, or *terrestrial* globe, the distribution of land and water, the divisions and subdivisions of the former, together with a few of the most important places, are laid down in positions corresponding to

those which they actually occupy on the surface of the earth. The usual mode of making such globes is as follows: A ball of wood or iron is used as a matrix, and a layer of damped paper is carefully and closely placed upon this, without paste, and other layers are successively pasted over the first one. Ordinary cardboard is thus produced, but instead of being flat, as usual, it forms a spherical shell. When sufficiently thick, this is cut into two hemispheres, the section being made in the line of the intended equator. The hemispheres are then taken off the matrix and again glued together on an axis, and the whiting composition laid on, the outside of which is smoothed and finished to shape in a lathe. The workman has to lay on this composition evenly enough to balance the globe, in order that it may rest at whatever point it is turned. The smooth surface is now marked with the lines of latitude and longitude, and is covered with the paper on which the required geographical or astronomical delineations are engraved. In order to adapt the plane surface of the paper to the curvature of the sphere, it is printed in pieces, small circles for the Arctic and Antarctic regions, and the rest in lens-shaped gores, varying from 20° to 30° of longitude. Great care is required in laying on these curved pieces, so that their edges shall meet exactly without overlapping. The surface is then colored and strongly varnished, and the globe mounted in its frame and stand.

Globes of india-rubber and gutta-percha have also been made, others of thin paper, to be inflated and suspended in a school-room. Embossed globes show, in exaggerated relief, the elevations and depressions of the earth's surface. Compound globes, including the celestial and terrestrial, have been made with an outer glass sphere for the celestial, and an orrery (q.v.) mechanism to show the varying relative positions of the sun and moon, etc. As school-room apparatus, globes are used for the purpose of illustrating the form and motion of the earth, the position and apparent motion of the fixed stars, and for the mechanical solution of a number of problems in geography and practical astronomy. For this purpose, each globe is suspended in a brass ring of somewhat greater diameter, by means of two pins exactly opposite to each other, these pins forming the extremities of the axis round which it revolves, or the north and south poles. This brass circle is then let into a horizontal ring of wood, supported on a stand. The globes in common use in schools are from one to four feet in diameter, but much larger ones have been constructed. Several so-called mammoth globes of the earth and moon have been made, but they have no real value, either for purposes of instruction or for scientific research.

GLOBE, THE. A famous Elizabethan theatre, where most of the plays of Shakespeare, Jonson, Beaumont, Fletcher, Chapman, Massinger, and Ford were first produced. It was erected in Bankside, by the Burbage brothers, in 1599, and was built chiefly from the material of their earlier theatre in Shoreditch. Its hexagonal outer wall inclosed a circular pit, flanked by three galleries, the pit being open to the sky, while the galleries were roofed with thatch, which caught fire in 1613, during a representation of *Henry VIII.*, and caused the destruction of the building. It was soon rebuilt, but was destroyed in

1644 by the Puritans, and a brewery now occupies its site.

GLOBE AMARANTH. See AMARANTH.

GLOBEFISH. A marine fish of the family Tetraodontidae and order Plectognathi (q.v.), remarkable for its power of inflation. These fishes possess a large, ventral, bladder-like expansion of the œsophagus, which may be filled with water or air so suddenly that the body assumes at once a spherical form. The skin is stretched to its utmost extent, and becomes firm. The scales are mostly reduced to spines imbedded in the skin, and these spines now stand upright, and form an important protective covering. This power of swelling suddenly must be regarded as an adaptation for defense, since the distended fish can hardly be grasped with impunity by the mouth of any predaceous animal. The fishes of this group are chiefly tropical, and some species are as large as a football, or larger, and used as food. Two or three species occur along the eastern coast of the United States, of which one (*Spheroïdes turgidus*) is very abundant, especially along the rocky shores of southern New England and Long Island, where it is known as swelldoodle, puffer, eggfish, and bellows-fish. It is often caught with a hook, and hundreds, usually small, are taken with every haul of a seine. When lifted from the water it immediately inflates its body by means of short, jerking inspirations of air, and if dropped on the ground will bound about like a rubber ball; or if thrown in the water will bob about for some time at the surface, with little control over its movements, and relieving itself with difficulty of its inflation. It forms a very amusing tenant of a salt-water aquarium. A well-known globe-fish of the Nile is the fahaka (*Tetrodon fahaka*). A large edible West Indian species (*Lagocephalus laevigatus*) is better known as 'rabbit-fish.' See Plate of PLECTOGNATH FISHES.

GLOBE-FLOWER (*Trollius*). A genus of plants of the order Ranunculaceæ, with a calyx of yellow sepals and a corolla of small and linear petals. There are several species, natives of the colder parts of the Northern Hemisphere. The common globe-flower, the lucken gowan of the Scotch (*Trollius europæus*), a native of Great Britain, is sometimes cultivated in flower-gardens. The globe-like appearance of the flower suggests the name.

GLOBIGERINA (Neo-Lat., from Lat. *globus*, ball + *gerere*, to carry). A genus of multilocular perforate foraminifera, with minute shells of glassy, calcareous texture and globular form. They are exceedingly abundant in many portions of the ocean bottom, where they form the greater proportion of the 'globigerina ooze.' Specimens referred to the genus Globigerina have been found in the Lower Cambrian rocks of the Province of New Brunswick, Canada. Their next appearance is in Triassic rocks. But they do not attain prominence till Tertiary time, when they became quite as abundant as they are at present. See FORAMINIFERA; OOZE; OCEAN DEPOSITS.

GLOBIN. See GLOBULINS.

GLOBOID (from Lat. *globus*, ball + Gk. *eidōs*, *eidos*, form). A spheroidal mass of a double phosphate of calcium and magnesium found in aleurone-grains. It is supposed to be

a by-product of the formation of the crystalloid in those bodies. See ALEURONE.

GLOBULINS (from *globule*, from Lat. *globulus*, diminutive of *globus*, ball). A name applied in physiological chemistry to a number of proteid substances that are insoluble in distilled water, but dissolve in dilute solutions of common salt or other neutral salts. The following are the best-known members of the group:

(1) **GLOBULIN** proper, or **CRYSTALLIN**, obtained by rubbing together the crystalline lens of the eye with fine sand and a little salt, digesting the mass with water, filtering, and passing carbonic-acid gas through the highly diluted filtrate, the globulin being then precipitated in a practically pure state. The crystalline lens of the eye contains nearly 25 per cent. of this substance.

(2) **VITELLIN**, a substance very similar to, if not identical with, globulin or crystallin. Vitellin is the chief proteid constituent of the yolk of egg, in which it is found associated with lecithin, and from which it may be obtained, in a more or less impure state, as follows: The yolk is treated with ether repeatedly, till no more coloring matter is extracted; the residue is dissolved in a little 10 per cent. common salt solution; on filtering, the vitellin may be precipitated by the addition of a large excess of water. The precipitate may be purified to some extent by again dissolving it in a little common-salt solution, and again precipitating with an excess of water. As thus obtained, vitellin is a white, granular body, insoluble in water, but very soluble in solutions of common salt, and in dilute solutions of sodium carbonate. Much vitellin is found in caviar, and some probably occurs in plants.

(3) **PARAGLOBULIN**, or **SERUM GLOBULIN**, a characteristic constituent of blood-serum and of lymph, may be prepared as follows: When blood-serum is diluted with 10 parts of water, and carbonic-acid gas is rapidly passed through it, a flocculent precipitate is formed, which becomes granular and easily separable by decantation or filtration. It should be washed with water containing carbonic acid, to prevent re-dissolving. A more complete separation from serum may be effected by saturation with sulphate of magnesia. This yields, according to Hammarsten, about 4.6 parts in 100; but the amount varies in different animals. It occurs in smaller quantities in lymph, chyle, serous fluids, etc. Paraglobulin coagulates at about 69° C. (154°-158° F.).

(4) **FIBRINOGEN**, a substance similar to paraglobulin, along with which it is found in blood-plasma. It is also found in hydrocele fluids, in chyle, etc. By the action of the fibrin ferment it is almost entirely converted into fibrin (q.v.). Fibrinogen may be prepared as follows: Magnesium sulphate is added to blood, which is then centrifugalized, and mixed with an equal volume of a concentrated solution of common salt. The precipitate thus obtained is washed with a strong solution of common salt, and is purified by first dissolving in dilute common-salt solution and then precipitating by addition of more salt, fibrinogen being soluble in dilute, but insoluble in concentrated solutions of salt. Fibrinogen coagulates at 55°-56° C. (131°-133° F.).

(5) **MYOSIN**, the chief constituent of dead, rigid muscle, may be prepared as follows: Dead muscle

substance is chopped up and washed with water; it is then digested with a solution of ammonium chloride and let stand for about thirty hours; the solution is then filtered and added slowly to a large quantity of distilled water; finally, the flocculent precipitate of myosin thus obtained is purified by again dissolving in a little ammonium-chloride solution, and again precipitating by addition to a large amount of distilled water. Myosin coagulates at about the same temperature as fibrinogen. If left for a long time in water, myosin is converted into an insoluble proteid substance. Acids transform myosin into syntonin (q.v.). In muscles, myosin is formed from another proteid, called *mysynogen*, by the action of a specific ferment. Myosin is easily digested by pepsin.

(6) **GLOBIN**, an insoluble proteid substance produced by the spontaneous decomposition of hæmoglobin in the air. Globin is but little soluble in solutions of common salt and in alkalies, and even less in dilute acids. This substance is as yet imperfectly known.

GLOBUS HYSTERICUS (Lat., hysterical ball), or BALL IN THE THROAT. See **HYSTERIA**.

GLOCKENSPIEL, glök'en-spël (Ger., bell-play). A musical instrument originally consisting of bells fastened to an iron rod, and rising above one another in the form of a pyramid. The bells were struck by means of a hammer with a metal head. Later the glockenspiel was constructed in the shape of a lyre, within which metal bars, instead of bells, were fastened. The bars yield a fuller tone than the bells. The instrument is now also constructed so that metal bars are arranged within a box. In this form the glockenspiel is used in the modern opera orchestra, and has a range from b' to d'. The music is written an octave lower than it sounds. Wagner employs the glockenspiel in the magic fire scene in *Die Walküre*.

EARLY FORM
OF GLOCKEN-
SPIEL.

GLOCKNER, glök'nër, or **GROSSGLOCKNER**, grös-glök'nër. One of the highest peaks of the Austrian Alps, situated on the boundary between Tyrol, Carinthia, and Upper Austria (Map: Austria, C 3). Its altitude is 12,344 feet.

GLOGAU, glô'gou, or **GROSSGLOGAU**. The capital of a circle and a second-class fortress in the Prussian Province of Silesia, situated on the left bank of the Oder, 60 miles northwest of Breslau (Map: Prussia, G 3). The town is fortified on three sides, and connected by a wooden bridge with a fortified island in the Oder. The more prominent buildings of Glogau are the old castle, the Rathaus, with a high tower, and the post-office. The Protestant gymnasium dates from the beginning of the eighteenth century, and the Catholic from 1626. Glogau has a prominent geographical institute, a municipal theatre, and a number of benevolent institutions. The manufacturing industries are but slightly developed. The chief products are sugar, starch, machinery, pottery. The railway shops are extensive. There is some trade in wine. Population, in 1890, 20,529; in 1900, 22,136. Glogau was

an important and fortified place as early as the beginning of the eleventh century, and became in the thirteenth century the capital of the Principality of Glogau. At the end of the fifteenth century the town, together with the principality, fell into the hands of Bohemia. During the Thirty Years' War Glogau was captured repeatedly by the Swedes and the Imperial troops, and in 1741 it was taken by storm by the Prussians, and strongly fortified.

GLOGAU, GUSTAV (1844-95). A German philosopher. He was born at Laukschken, East Prussia, and was educated at Berlin. In 1882 he was appointed professor at the Polytechnical Institute at Zürich, and in the following year was appointed professor extraordinary at Halle, whence in 1884 he was called to the chair of philosophy at Kiel. In 1895 he entered upon a tour through Greece, where he met his death in an accident. Glogau regards philosophy as a science embodying the results of all achievements, and thus represents it as a natural growth, inseparable from evolution in its widest sense. Besides his principal work, *Abriss der philosophischen Grundwissenschaften* (1880-88), he published: *Ziel und Wesen der humanistischen Bildung* (1881); *Grundriss der Psychologie* (1884); *Die Ideale der Socialdemokratie und die Aufgabe des Zeitalters* (1892); *Die Hauptlehren der Logik und Wissenschaftslehre* (1894); and *Das Vorstadium und die Anfänge der Philosophie*, edited by Siebeck (1896).

GLOGGNITZ, glög'nits. A small town of Lower Austria, situated on the Schwarza, at the northern base of the Semmering Alps, 45 miles south-southwest of Vienna (Map: Austria, E 3) on the Vienna and Triest Railway. The building of the railway from here to Mürzschlag, a distance of 35 miles, was an extraordinary feat of mountain engineering. The line was constructed in 1848-54, at a cost of about \$10,000,000. Gloggnitz has a picturesque castle situated on a hill. Down to 1803 it was a Benedictine abbey, but afterwards became a private residence. To the southwest lies the interesting Castle of Warthenstein. Population, in 1900, 2249.

GLOMERULE, glôm'ër-ül (from Lat. *glomus*, ball of yarn). A flower-cluster (inflorescence) which is merely a cyme (q.v.), in which the flowers are crowded so close together as to form a sort of head, as seen in some species of dogwood. See **INFLORESCENCE**.

GLOMMEN. The largest river of Norway, issuing from Lake Aursundsjø, at the town of Røros, at an altitude of about 2300 feet (Map: Norway, D 6). It flows in a general southwest direction past the fortress of Kongsvinger, emptying into the Skagerrak at Fredrikstad, after a course of 350 miles. Its most important affluent is the Vorma. The Glommen forms a number of lakes and several waterfalls, which greatly detract from its usefulness as a navigable waterway. Boats ascend to the last waterfall, about 10 miles from the mouth of the river, and above this fall the river is navigable for about 20 miles.

GLONONIN, glôn'ô-in. See **NITROGLYCERIN**.

GLO'RIA IN EXCELSIS (Lat., Glory be to God on high). The first words and the title of one of the oldest Christian doxologies, **EASTERN**

in origin, and in use for more than fifteen hundred years. In the English Church and American churches it forms part of the communion office, and is a substitute for the Gloria Patri after the Psalter. See DOXOLOGY.

GLORIA'NA. The "Faerie Queene" in Spenser's famous poem of that name, for whose honor the various combats against vice are undertaken, and who is Prince Arthur's fated bride. She shadows forth Queen Elizabeth in her capacity of sovereign.

GLORIA PATRI (Lat., Glory be to the Father). The minor doxology in the Christian Church. It is used after the selections from the Psalter and at the end of the anthems.

GLORIOUS VIRGIN, or SAINT MARY THE GLORIOUS. An Order of knighthood, founded by Bartholomew of Vicenza in 1233, and approved by Pope Urban IV. in 1262. This institution was ecclesiastical as well as military, and its objects were the protection of widows and orphans, and the furtherance of the peace of Italy by the suppression of the strife between Guelphs and Ghibellines. The badge was a purple cross between stars, and the costume a white surcoat on a russet cloak. The Order of Saint Mary the Glorious, at Rome, was sanctioned by Paul V. in 1618. Its object was to suppress the Barbary corsairs who infested the Mediterranean. To make the Order effective, the Pope gave the knights command of his galleys, and set apart the town and harbor of Civitavecchia for their use.

GLORY (in meteorology). See HALO.

GLOSS (from Lat. *glossa*, gloss, Gk. γλῶσσα, *glōssa*, tongue). A brief note or explanation written upon the margin or between the lines of a manuscript by some reader. In subsequent copyings such glosses often became incorporated as a part of the text. The object was generally to explain some purely verbal difficulty. Words which are commonly the subject of such explanations are reducible to five classes: (1) foreign words; (2) provincialisms or dialectic expressions; (3) obsolete words; (4) technical words; and (5) words used by the author in some abnormal or exceptional signification. From an early period these verbal difficulties were the object of attention, and the writers who devoted themselves to their elucidation were called *glossatores*, and their works *glossaria*. The principal Greek glossatores are Hesychius of Alexandria (fourth century), Photius (q.v.), Zonaras (twelfth century), Suidas (q.v.), and Favorinus, a Benedictine (died 1537). Most of the rabbinical writers did the same work for the Hebrew text of the Old Testament. The chief glossatores of the Latin Vulgate are the celebrated Walafrid Strabo (q.v.), in the ninth century, author of the *Glossa Ordinaria*, and Anselm of Laon, author of the *Glossa Interlinearis*, who continued Walafrid's work in the twelfth century. Their work was the great storehouse of mediæval exegesis. It was printed with the Latin text in an edition of the Vulgate in 1480. In Roman and canon law, the practice of introducing glosses was of early origin and probably was in imitation of the biblical glosses. Among jurists, the gloss was not purely verbal, but had to do with the true interpretation of the law, and in some cases it was held to be of equal authority with the text itself.

From the position which it occupied in the manuscript, being generally written between the lines of the text, it was called *glossa interlinearis*. The gloss of the Roman law is written in very pure Latin, that of the canon law in the Latinity of the mediæval schools. The first collection of glosses to the canon law was made by Johannes Semeca (Teutonicus) in 1212. It accompanied the *Decretum Gratiani* and was printed in connection with it (Lyons, 1584). Other divisions for the *Corpus Juris Canonici* also had glosses, and they are given in the edition mentioned above.

GLOSSITIS (Neo-Lat., from Gk. γλῶσσα, *glōssa*, tongue). A term used in designating inflammatory diseases of the tongue. *Glossitis superficialis simplex* occurs with great frequency in febrile and digestive disorders accompanied by 'coated tongue' or 'strawberry tongue.' Chronic superficial glossitis occurs often in hypochondriacs, especially in women; the tongue burns, is painful, especially during eating or speaking, and is dotted with red spots and white nodules. It may last for years, with intermissions of weeks or months. Treatment with nitrate of silver or lactic acid is palliative. Hairy tongue is a rare glossitis in which, surrounding a smooth, yellow, brown, or black area, the papillæ are smaller and resemble bristles. The treatment consists in scraping and the application of antiseptics. In 'geographical tongue,' bright red plaques appear, slightly elevated and circumscribed by a gray marginal zone. The forms of the maps change frequently. The trouble generally disappears without treatment. Acute papulose glossitis is extremely rare. In acute diffuse glossitis, or abscess of the tongue, the latter becomes enormously swollen, and the chief dangers of the attack are suffocation from swelling of the parts about the hyoid bone, closure thereby of the glottis (see LARYNX), and general infection. The only really effective treatment is to make pretty deep incisions into the inflamed part, keeping in view that the resulting wound is likely to be much less than appears at the time; for the enlargement of the organ has stretched the mucous membrane, and infiltrated all the textures with fluid, while the vessels are also distended with blood. A straight bistoury should be boldly plunged into the upper surface and several incisions made lengthwise sufficiently deep to evacuate the pus. A good deal of blood will usually follow, but if care has been taken not to injure the lingual artery or its branches (see TONGUE), there is no real danger from this cause. In places at a distance from medical advice, this operation might require to be performed by unskilled hands, and with a penknife, or any other cutting instrument at hand. Care should be taken in this case to make the incisions on the upper surface, and not too far from the middle line. Glossitis is also caused by mercury, during mercurial stomatitis; by syphilis; by tuberculosis; by actinomycosis, etc.

GLOS/SOP. An ancient market town in Derbyshire, England, 13 miles east-southeast of Manchester, on a branch of the Manchester, Sheffield and Lancashire Railway (Map: England, E 3). It is situated on rising ground above the deep Dinting Valley, amid picturesque peak scenery. It is the chief seat of the cotton manufacture of Derbyshire, and has woolen and

paper mills, dye-works, print-fields, bleaching-grounds, and iron-foundries. The ancient parish Church of All Saints, the grammar school, mechanics' institute, and the town hall and market house are the principal buildings. Melandra Castle, the site of a Roman camp, is in the neighborhood. Glossop maintains public baths, free library, owns its water-works, and has a modern system of sewage-works and disposal. Population, in 1891, 21,256; in 1901, 22,416.

GLOSSOPTERIS (Neo-Lat., from Gk. γλῶσσα, *glōssa*, tongue + πτερίς, *pteris*, fern). A fossil fern of the family Tæniopteridæ, which is an important index fossil of certain Permian-Triassic beds of India, Australia, South Africa, and South America, known as the Gondwana series. This fern has thick, leathery leaves of linguæ form, with entire margin, median rib, and anastomosing veins. It is sometimes as much as 12 inches in length.

GLOSTER, or **GLOUCESTER**, glōs'tēr, Earl of. The father of Edgar and of the bastard Edmund, in Shakespeare's *King Lear*. He is deceived and betrayed by his illegitimate son, blinded by Cornwall, and guided through the country and saved from springing over Dover Cliff by the heir, whom he had unjustly disowned. His story is suggested by an episode in Sidney's *Arcadia*, entitled, "The Piteful State and Story of the Paphlagonian Unkind King and His Kind Son."

GLOT'TIS. See LABYXN.

GLOUCESTER, glōs'tēr (AS. *Glōwceaster*, fair city, Lat. *Glevum*, *Claudia*). An inland port, city, and civic county of ancient date, the capital of Gloucestershire, England, on the left bank of the Severn, 33 miles northeast of Bristol (Map: England, D 5).

The city is built on a slight declivity, sloping to the Severn, and is sheltered by the surrounding Coteswold and Malvern Hills. The modern portion is in the neighborhood of the public park and spa, which contains the chalybeate spring, discovered in 1814. The four main streets, named after their orientation, are wide, and built on the ancient Roman ground plan, meeting at right angles in the centre of the town, where the former town hall, the historic Tolsey, stands at the intersection, on the site of the old Roman Capitol. Other buildings and objects of interest are the picturesque deanery, formerly the old priory lodge; the New Inn, a pilgrim's hostelry, built in 1540; the episcopal palace; the new guildhall; and many quaintly gabled timbered houses. A cross marks the spot where Bishop Hooper was burned. The principal building in Gloucester is the cathedral, restored since 1853, the foundation of which dates from the eleventh century. Formerly a Benedictine abbey, skillful alterations and additions evolved from the Norman body a fine building of Perpendicular aspect, which, in 1541, after the suppression of monasteries, was converted into a cathedral by Henry VIII. The chief external ornament is the stately central tower, 225 feet high, with its beautiful tracery and pinnacles. It contains the 'Great Peter' bell, weighing over three tons. Gloucester has three endowed ancient schools, in addition to several modern schools. It has an important municipal record: it received special charters from several monarchs, and Richard III. made it a county. It is governed by a mayor, nine

aldermen, and twenty-seven burgesses. It owns its markets, water-works, cemetery, public baths, technical schools, public library, electric-lighting supply, and dust-destroyer works. It has manufactures of railway engines and wagons, agricultural implements, and cutlery. There are boat and ship building yards, foundries, flour and saw mills, and chemical, rope, match, marble, and slate works. Bell-founding and cloth and pin manufactures were once important industries which no longer exist. A ship canal 17 miles long, communicating with the estuary of the Severn below Sharpness Point, gives access to the spacious docks. The famous bore or tidal wave of the Severn attains its greatest height just before reaching Gloucester. Considerable commerce is carried on with the Baltic and other foreign ports; corn, timber, wines, and spirits are imported; iron and coal, bricks, pottery, salt, malt, and agricultural products are exported. Gloucester is the seat of an American consular agent.

Gloucester was an important Saxon town, styled by Bede 'one of the noblest cities in the land.' It suffered greatly during the period of the Danish incursions. It was a favorite residence of the Norman kings, and was the seat of eight parliaments. Gloucester afforded a refuge and support to Queen Matilda in her contest with Stephen, and Henry III., who 'loved Gloucester better than London,' was crowned in the abbey. In 1643 Gloucester successfully resisted the royal army under Charles I. until relieved by Essex, and at the Restoration its fortifications were dismantled for this 'malignity.' Robert of Gloucester, the metrical historian, Whitefield, and Wheatstone are among Gloucester's celebrities. Consult Masse, *The Cathedral Church of Gloucester* (London, 1898).

GLOUCESTER. A city and port of entry in Essex County, Mass., including the villages of Annisquam, Bay View, East Gloucester, Freshwater Cove, Lanesville, Magnolia, Riverdale, and West Gloucester, 31 miles northeast of Boston; on Massachusetts Bay, near Cape Ann, and on the Boston and Maine Railroad (Map: Massachusetts, F 2). It is a popular resort for summer residents, artists, and tourists, and has the Gilbert Hospital, Gilbert Home, Huntress Home, Magnolia, public, and Sawyer free libraries, and Stage Fort and Marine parks. The city is the seat of the largest fishery interests in the United States, over 5000 men being engaged in the cod and mackerel fisheries. There is a large, accessible, and safe harbor, and salt, coal, and lumber are extensively imported. Besides the fisheries and the quarrying of granite, the principal industries are ship-building, drop-forging, brass-founding, and the manufacture of fish glue, anchors, machinery, oil clothing, nets and twine, sails, cigars, and shoes. In 1623 a company from Dorchester, England, settled at Gloucester, but three years later removed to Naumkeag (Salem). The permanent settlement dates from about 1633, and a town charter was granted in 1642. It was not until the beginning of the eighteenth century that Gloucester became especially prominent for its fisheries and its ship-building industries. Many privateers were sent out during the Revolution and the War of 1812, and the town was unsuccessfully attacked by the English in 1775. A number of disastrous shipwrecks have occurred

GLOUCESTER CATHEDRAL

in the immediate vicinity, and near by is the large sunken rock called Norman's Woe, rendered famous by Longfellow's "The Wreck of the Hesperus." Gloucester was incorporated as a city in 1873, the charter of that year still being in operation. The government is administered by a mayor, elected annually, and a bicameral council. The city owns and operates its water-works. Population, in 1890, 24,651; in 1900, 26,121.

GLOUCESTER, DUKES AND EARLS OF. ROBERT, first Earl of Gloucester (?-1147), was a natural son of King Henry I., and as the champion of the cause of his sister Matilda, won the famous battle of Lincoln over Stephen of Blois.—**RICHARD DE CLARE** (1222-62), seventh Earl, was active on the side of the barons under Henry III., but later quarreled with Simon de Montfort.—**GILBERT**, eighth Earl, surnamed the 'Red' (1243-95), was one of the principal leaders of the barons in their conflict with Henry III., but afterwards joined the royal cause, and was Regent during the absence of Edward I.—**GILBERT**, ninth Earl (?-1314), a son of the preceding and of the daughter of Edward I., was leader of the advance guard at the battle of Bannockburn, in which he fell. The line soon afterwards became extinct, but was renewed in **THOMAS OF WOODSTOCK**, Earl of Buckingham (1355-97), the youngest son of Edward III., who was made Duke of Gloucester by his uncle, Richard II., in 1385, and who later acquired an extraordinary political influence, and dominated the affairs of England for several years. Among the later conspicuous representatives of the title were **HUMPHREY**, Duke of Gloucester, the youngest son of Henry IV. (1391-1447), who was Protector during the minority of Henry VI.; **RICHARD**, brother of King Edward IV., and King of England as Richard III.; **WILLIAM HENRY** (1734-1805), a brother of George III., and **WILLIAM FREDERICK** (1776-1854), a son of the preceding.

GLOUCESTER CITY. A city in Camden County, N. J., one mile south of Camden; on the Delaware River, opposite Philadelphia, with which it is connected by ferry, and on the Atlantic City and the West Jersey and Seashore railroads (Map: New Jersey, B 4). It has manufactures of incandescent gas-burners, calico prints, gingham, woolen yarns, boats, and drills, etc. Settled in 1677, Gloucester City was incorporated in 1868, and is governed under the charter of that date, which provides for a mayor, elected every two years, and a unicameral council. The city owns and operates its water-works. Population, in 1890, 6564; in 1900, 6840.

GLOUCESTERSHIRE. A southwest county of England, bounded by Worcester and Warwickshire on the north, Oxford on the east, Wiltshire and Somerset on the south, and Monmouth and Hereford on the west (Map: England, D 5). Area, 1243 square miles. Gloucestershire is famous as a dairy county, and raises large numbers of cattle. From the orchards of Gloucestershire large quantities of cider are obtained. The Forest of Dean has some iron deposits. The manufactures are numerous and important. The county contains the Parliamentary boroughs of Cheltenham and Gloucester, and part of the Parliamentary borough of Bristol. Capital, Gloucester. Population, in 1891, 599,950; in 1901, 634,700.

GLOUVET, glōv'vâ', JULES DE. See **QUESNAY DE BEAUREPAIRE**, JULES.

GLOVE (AS. *glōf*; perhaps connected with Goth. *lōfa*, Icel. *lōfi*, Eng. *loof*, palm of the hand). A covering for the hand having a separate sheath for each finger, as distinguished from a mitten, in which there is a separate compartment for the thumb only. The glove is a very ancient article of dress. It has been found in the relics of the cave-dwellers, made of leather and sewn with leather thread. Gloves were worn by the ancient Greeks, but chiefly as a protection for the hands in doing heavy work, rather than as an ornamental part of the dress. By the Romans they were worn as ornaments, and were considered a sign of rank. While something in the form of a protection for the hands from cold must always have been needed by northern nations, gloves did not become an important article of dress until after the Norman Conquest. It is thought that the custom of carrying a pet falcon upon the wrist led to their general use. During the eighth and ninth centuries they were worn chiefly by persons of noble birth. Hence they were considered a sign of rank and were taken off, as a token of respect, before a superior or in churches. They were worn in the hat as favors and cast down as a challenge. By the sixteenth century gloves were worn by all classes, and then, as now, were made of silk, worsted, and leather. Those worn by the wealthy were most elaborately ornamented with embroidery and lace. As early as 1190 a guild of glove-makers was formed in France, which took upon itself the task of maintaining honest workmanship among glove-makers, and in introducing constant improvements in methods of manufacture. In Scotland the gloves of Perth were incorporated in 1165. Nearly five centuries later a company of glovers was organized in London, and that city has been an important centre of glove manufacture ever since. At one time glove-making was an important industry in Ireland, and the famous 'Limerick' glove was widely esteemed for its exquisite texture and workmanship. For many centuries France has excelled in the number and quality of gloves manufactured in some of her cities.

GLOVE MANUFACTURING IN THE UNITED STATES. The manufacture of leather gloves in the United States is said to date back to the days of Sir William Johnson in New York State. In 1760 he induced several families of glove-makers from Scotland to settle on his grants, who brought over with them their glove patterns, and the necessary needles and thread for glove-making. Gloves continued to be made in this locality and gradually the demand for them spread until by 1825 they had found a market in Albany and Boston. These early gloves, as compared with modern productions, were crude and clumsy. They were cut with shears from pasteboard patterns, the cutting being usually done by men and the sewing by women. Later, dies were introduced for cutting and were a great improvement. The invention of the sewing-machine in 1852 marked the beginning of a new era in glove manufacture, and soon all hand work was superseded. Steam-power for running the sewing-machines was introduced in 1875. From the start glove-making has been, to a large extent, a household industry, and it still gives employment to a large number of home workers. The cutting

and the stitching on the backs are done at the factories before the gloves are sent out.

GLOVE-MAKING PROCESSES. The term 'kid' is a mere technicality, as the quantity of leather bearing this name yearly consumed is largely in excess of what could be supplied from the skins of all the young goats that are annually slaughtered. Gloves are largely made from lamb-skin. The finest gloves, however, are made from real kid, derived chiefly from Germany, Austria, Sweden, Brazil, Madagascar, and, lately, from France and Bavaria. The younger the kid, the thinner, finer, and softer the glove. Lamb-skin is tougher and harder to work than kid-skin, but it is said that none but an expert can tell the difference in their appearance. The so-called dog-skin, buckskin, and doeskin gloves are made chiefly from sheepskin; some of the thickest kinds of leather gloves are made from calfskin. *Suede* gloves are those in which the inside of the skin is used as the outside of the glove, the name being derived from the Swedish manner of making up gloves. *Glacé* gloves are made with the outside of the leather retained as the outside of the glove.

The leather, in all cases, undergoes a much lighter dressing than when used for boots and shoes. The skin having been freed from hair and cleaned, it is prepared for use by one of the three processes of dressing—tanning, tawing, or shamoying—described under **LEATHER**. For light dress gloves the skins are usually tawed. The leather is next broken or 'staked' to render it pliable and even in texture. It is then colored, by painting lightly on the outside, two or three coats, with a brush, so that the inside will not be affected by the coloring. White gloves are simply undyed gloves. When the dye is thoroughly dried, the superfluous color is removed and the surface rubbed with a size. The gloves are now 'doled' on a marble slab, to remove the dirt and irregularities. After the leather has been properly prepared the gloves are cut out by means of dies. The die cuts out all the parts, including the gussets. A single glove consists of from 16 to 19 pieces. The large skins are used for mousquetaire gloves, but one pair of which can be made from a single skin, though ordinarily two pairs of ordinary gloves can be made from one skin. The scraps that are left, unless the skin was tanned, are used for glue. The first and fourth fingers are completed by gussets or strips sewed only on the inner side, but the second and third fingers require gussets on both sides to complete the finger. Besides these, small pieces of a diamond shape are sewed in at the base of the fingers, toward the palm of the hand. The stitching of the parts together, and also the ornamental stitching on the back of the hand, is done by specially made sewing-machines. The putting on of the thumb-piece requires special skill and management, and badly made gloves commonly give way at this point.

In the American glove-factories there are two classes of cutters, the block and the table cutters, the former of whom are engaged chiefly on the cheaper grades of gloves. The block cutter simply cuts out the glove with a die and hammer, from a skin which is laid on a block of wood. The table cutter first dampens his skin, stretches it to the fullest possible extent, and cuts off the length of a glove. He then stretches it again and cuts it to width, after which the fingers

are cut to shape with a die. A table-cut glove is more elastic and hence fits better than one cut on the block. The table cutters employed in America are mostly foreigners from the glove-manufacturing centres of Europe, and many of them come from families which for centuries have been engaged in the glove-making industry. To be a good cutter requires not only great experience, but natural dexterity and rare judgment in selecting leather so as to cut out the greatest possible number of gloves and yet avoid flaws.

GLOVES NOT MADE FROM LEATHER. The manufacture of woven and knit gloves is an entirely separate branch of the trade. Sometimes the material is first woven and then cut and made up similarly to the leather gloves, or they may be knit into shape by special knitting-machines.

STATISTICS. The centre of the glove industry in the United States is still in Fulton County, N. Y., in the vicinity where Sir William Johnson planted his first colony of glove-makers. Of the 381 glove-factories in the United States, 243 are in that county. The remaining establishments are scattered over the entire country. These 381 establishments represent a combined capital of \$9,004,427, and they turn out an annual product valued at \$16,721,234. This business has shown a steady growth since 1850, when the first census report of the industry was published. At that time there were already 110 glove-factories in the country, with a capital of \$181,200 and an annual product of \$708,184. Of the 2,895,661 dozen pairs manufactured in 1900, all but 323,826 dozen pairs were men's gloves, as the finer grades of women's gloves are still chiefly produced in Europe.

Consult: Hunt, "Leather Gloves and Mittens," in vol. ix., *Manufactures*, part iii., *Twelfth Census of the United States* (Washington, 1902); Beck, *Gloves, Their Annals and Associations* (London, 1883); Frothingham, *History of Fulton County, N. Y.* (Syracuse, 1892).

GLOVE, THE. A story originally told (about 1550) by Pierre Ronsard, and later variously adapted by Schiller, Leigh Hunt, and Browning. It tells of a lady who tosses her glove into a lion's den and commands her lover to fetch it back. He springs down, and, returning unharmed, hurls it in her face in scorn at her capricious cruelty.

GLOVER, glŭv'ər, CATHERINE. The heroine of Scott's *Fair Maid of Perth*, whose appellation among her neighbors suggests the title of the story.

GLOVER, JOHN (1732-97). An American soldier, prominent in the Revolutionary War, born in Salem, Mass. He removed to Marblehead when very young, was a shoemaker for a time, and afterwards engaged in the fishing business. In February, 1773, he was chosen colonel of a militia regiment which upon the outbreak of the Revolution became a part of the Continental Army, as the Fourteenth Regiment, better known as the 'Marine Regiment.' On October 4, 1775, he was placed in charge, with Stephen Moylan, of the equipment and manning of armed vessels and cruisers designed for service against the British, and until July, 1776, was stationed at Beverly, Mass. He then was ordered to New York, and on the night of August 28th-29th, after the battle of Long Island, conducted the transfer of the American army from Long Island to New York.

He was placed in command of General Clinton's brigade on September 4th, took part in the battle of White Plains, and on December 25th manned the boats in which Washington and his army effected the passage of the Delaware before the attack upon Trenton. On February 21, 1777, he was appointed brigadier-general by the Continental Congress, and afterwards took an active part in the campaign against Burgoyne; was placed in charge of the British prisoners on their march from Saratoga to Cambridge; took part in General Sullivan's Rhode Island expedition in July and August, 1778; was a member of the court which tried Major André, and was officer of the day when André was executed; and in July, 1782, was retired on half pay. Subsequently until his death he lived at Marblehead, and in 1788 was a member of the Massachusetts convention which ratified the Federal Constitution. His orderly books and a letter-book containing his Revolutionary correspondence are in the possession of the Essex Institute at Salem, Mass. Consult Upham, *A Memoir of General John Glover of Marblehead* (Salem, 1863).

GLOVER, JOHN (1767-1849). An English landscape painter, born in Leicestershire. He was self-taught in art, having been master of the Appleby Free School from 1786 to 1794. He went to London in 1805, and joined the Water-Color Society, of which he became president in 1815. He received a gold medal at the Paris Exhibition in 1814, and in 1823 he took a prominent part in the foundation of the Society of British Artists. He went to Australia in 1831, and sent to England his sketches of native scenery, until his death in Tasmania. He was an artist of some skill and originality, especially skillful in aerial perspective, but his work became mannered. He also painted in oils, but not with equal success. Among his water-colors are views of "Tivoli," "Windsor Castle," and a "River Scene," in the South Kensington Museum. One of his best oil paintings is a "Landscape with Cattle," in the British Museum.

GLOVER, Mrs. JULIA BETTERTON (1779-1850). An English actress, born at Newry. The daughter of an actor, she began to play juvenile parts about 1789. In 1795 she made her formal debut as Marianne, in Reynolds's *Dramatist*. Her repertoire included Lydia Languish, Widow Green in *The Love Chase*, and the Queen in *Richard III*. Her last appearance on the stage was as Mrs. Malaprop, at Drury Lane only a few days before her death, July 16, 1850. Remarkable for her memory, she was during her middle life considered the best comic actress of the time, and in later years was styled the 'Mother of the Stage.' Consult the memoir by Mrs. Wilson in *Our Actresses* (vol. ii., London, 1844); and Cook, *Hours with the Players* (London, 1881).

GLOVER, RICHARD (1712-85). An English poet. He was the son of a London merchant, and after attending school at Cheam, in Surrey, he entered his father's business. In 1762-68 he sat in Parliament for Weymouth. Though he never attended either university, he acquired, it is said, a good knowledge of Greek. At least, most of his poems are founded on Greek subjects. In his sixteenth year he wrote some verses commendatory of Sir Isaac Newton. In 1737 appeared *Leonidas*, an epic in blank verse running through 9 books, subsequently (1770) extended to

12 books. Once popular, the poem is no longer read. Its sequel, the *Athenaid* (30 books, 1787), probably no one ever read. He wrote several heavy tragedies: *Boadicea* (1753), *Medea* (1761), and *Jason* (1799). His fame now rests upon the spirited "Ballad of Admiral Hosier's Ghost," founded on Hosier's disastrous expedition to Porto Bello (1726). Glover died November 25, 1785. For his poems consult Chalmers, *Works of the English Poets*, vol. xvii. (London, 1810).

GLOVER, STEPHEN (1812-70). An English song-writer, born in London. He composed numerous songs and duets, including: "What Are the Wild Waves Saying?" "Stars of the Summer Night"; "Our Bark is on the Rhine"; "Annie on the Banks o' Dee"; and "There's a Sweet, Wild Rose."

GLOVER, WILLIAM HOWARD (1819-75). An English musical composer. He was born in London, and was the son of Mrs. Julia Glover, the actress. After completing his musical studies on the Continent, he founded, with his mother, the Musical and Dramatic Academy in London. In 1868 he settled in New York as leader of Niblo's orchestra. He produced a cantata, *Tam o' Shanter* (1855), an opera, *Ruy Blas* (1861), and several comic operas.

GLOVERSVILLE. A city in Fulton County, N. Y., 54 miles northwest of Albany, on the Fonda, Johnstown and Gloversville Railroad (Map: New York, F 2). It has a public library and the Nathan Littauer Hospital. Gloversville is the principal seat of the manufacture of gloves in the United States, its factories with those of the neighboring city of Johnstown controlling a large proportion of the entire production of the country. Besides gloves and mittens, there are extensive manufactures of glove and shoe leather. Settled during or just before the Revolution, Gloversville was known as Stump City from 1816 to 1832, when it received its present name. It was incorporated as a village in 1851, and was chartered as a city in 1890. The government, under the revised charter of 1899, is administered by a mayor, elected biennially, and a council which confirms the executive's appointments to the Board of Health, and elects all other officers, except standing committees, boards of civil service and plumbing, which are appointed by the mayor. The boards of education and water commissioners are chosen by the people. The city owns and operates its water-works. Population, in 1890, 13,864; in 1900, 18,349.

GLOVE SPONGE, or FINGER SPONGE (so called from the branching shape). An inferior sort of commercial sponge (*Spongia officinalis*) which takes a bushy form, sometimes two feet high. It grows on hard bottoms all along the coast of Florida and Bermuda, and is regarded as the poorest kind gathered, although closely related to the finest sort of sponge. See SPONGE.

GLOWWORM. See FIREFLY.

GLUB-DUB-DRIB. A land of magicians, soothsayers, alchemists, and the like, visited by Swift's Gulliver during his famous travels. The inhabitants, to entertain Gulliver, summoned the spirits of various notable men of olden times.

GLUCASE (from Gk. γλυκός, *glykys*, sweet). An enzyme also known as maltase, found in various species of yeasts, in some molds, and probably also in the seeds of germinating barley and

other cereals. It is also found in various parts of animal bodies. The glucase prepared from cereals differs somewhat in its action from that obtained from fungi; the latter acts best at a temperature of 40° C., and the former is most active at 57-60° C. Glucase acts upon maltose (sugar), breaking it up (by hydrolysis) into two molecules of glucose. It has also been found to decompose certain glucosides.

GLUCINUM, GLYCIUM, glīsh'ī-ūm (Neo-Lat., from Gk. γλυκίς, *glykys*, sweet), or **BERYLLIUM**. A metallic chemical element discovered by Wöhler in 1828. It is not found native, but occurs as a constituent of various minerals, such as beryl, chrysoberyl, and phenacite. Its existence as an oxide was recognized in beryl in 1798 by Vauquelin, but it was not until Wöhler obtained the impure metal by the action of potassium on fused glucinum chloride that the element itself may be said to have been isolated.

Glucinum (symbol Gl or Be; atomic weight 9.08) is a steel-colored, malleable metal that has a specific gravity of 2.1, and its melting-point is below 900° C. It is divalent and combines with oxygen, forming *glucinum oxide*, or *glucina*, a white infusible powder with a sweetish taste. The compounds of glucinum have no economic value.

GLÜCK, glük, CHRISTIAN FRIEDRICH VON (1755-1831). A German jurist, born at Halle. In 1784 he became professor of law in the University of Erlangen, Bavaria. Among his principal works are: *Ausführliche Erläuterung der Pandekten* (34 vols., 1790-1830; continued by other scholars, 1832-93); and *Handbuch zum systematischen Studium des neuesten römischen Privatrechts* (1812).

GLUCK, glōok, CHRISTOPH WILLIBALD (1714-87). A famous German composer and operatic reformer. He was born July 2, 1714, at Weidenwang, in the Upper Palatinate, where his father was forester to Prince Eugene of Savoy, and later to Prince Lobkowitz at Eisenberg. From 1726 to 1732 the boy attended a Jesuit seminary at Komotau, where he was taught singing, violin, 'cello, and organ. In the latter year he went to Prague to continue his musical studies, and was compelled to eke out a livelihood by playing in the neighboring villages. While there he heard and stored away in his memory many rustic tunes which later did service in his operas. Czernohorsky, noting his aptitude, took him as a pupil. In 1736 he went to Vienna, where, through the good offices of the Lobkowitz family, he met Prince Melzi. The latter became deeply interested in the young musician and took him to Milan, where Gluck continued his technical studies with Sammartini.

Gluck was twenty-seven years old when his first opera, *Artaserse*, was produced at La Scala. *Artaserse* led to commissions for other works, and within five years Gluck produced eight operas. His fame having reached England, he went to London in 1745 at the invitation of Lord Middlessex and produced *La caduta de' giganti* in honor of the Duke of Cumberland's victories. The time, however, was inauspicious, and *The Fall of the Giants* was withdrawn after only five performances. The performances of an earlier opera, *Artamene*, were more successful. Then occurred a circumstance of which Gluck's biographers have made much. To a libretto, *Piramo e Tisbe*, he

wrote a patchwork score from the most popular airs of his earlier operas. To the complete failure of this *pasticcio* is attributed the awakening of Gluck's mind to the true function of operatic music—the expression of given dramatic situations; although *Orfeo*, with which Gluck inaugurated his reform of opera, was not composed until sixteen years later.

In 1748, Gluck's father having died and left him a small inheritance, he settled in Vienna, which remained his principal place of residence for the rest of his life. On May 14, 1748, in celebration of the Empress's birthday, he produced in the recently completed opera house *La Semiramide riconosciuta*, which achieved great success. The spring of 1749 found the composer in Copenhagen, where he was received with distinction and lodged in the royal palace, and where he produced a two-act serenade, *Teside*, in honor of the recent birth of a Crown Prince (afterwards Christian VII.). In April of the same year he traveled in the guise of a Capuchin (for no other reason, it is believed, than to avoid trouble regarding passports) to Rome. There and in Naples he brought out a new two-act opera, *Telemacco, ossia l'Isola di Circe*, which was attended with his usual success.

Shortly afterwards Gluck returned to Vienna, where, in September, 1750, he married Marianne Pergin. They soon left Vienna for Naples, where he achieved great success with his opera *La clemenza di Tito*. In 1754, having produced, and again successfully, two operas, *Il Trionfo di Camillo* and *Antigone*, in Rome, the Pope created him a Chevalier of the Golden Spur, and thereafter the composer, who set great store by this title, was always careful to call himself Ritter von Gluck. Previous to this visit to Rome he had been appointed by Count Durazzo conductor of the Opera at Vienna. His productivity in this office was great, including the composition of light operas whose librettos Durazzo secured from Paris, where they were brought out with music usually by Duni and Monsigny, while the Viennese heard the same librettos with music by Gluck. Meanwhile Gluck was growing steadily in intellectual breadth. He became more and more dissatisfied with the flippant conventionalities of the Italian opera of the day—though he himself had composed an appalling number of works in that style—and, calling to his aid as librettist the Imperial Councillor Raniero di Calzabigi, who was in sympathy with his views on operatic reform, he produced at Vienna in October, 1762, *Orfeo ed Euridice*. This, his first great opera, is still a famous work and one of its airs ("Che farò senza Euridice") is a familiar concert number to-day. Though not immediately successful, *Orfeo* soon established itself in popular favor, not only in Vienna, but also in Italy, where, at Parma, Traetta was unable to obtain a hearing for his *Armida* because every one wanted to hear *Orfeo*. Gluck's other operas in his great style are *Alceste* (1767), *Paride ed Elena* (1769), *Iphigénie en Aulide* (Paris, 1774), *Armide* (1777), and *Iphigénie en Tauride* (1779).

The production of *Iphigénie en Aulide* in Paris was an important event in Gluck's life. It led to the hotly waged and now historic contest between the operatic reformers headed by Gluck and those who championed the existing style of opera. The latter put forward Piccini to oppose Gluck, but Gluck was overwhelmingly victorious. In

1780 he returned to Vienna, but ill health prevented him from accomplishing anything of importance, and he died in that city, November 15, 1787. Gluck's reform of the opera was his greatest service to music. He found it marred by senseless embellishments, and a mere vehicle for the display of singers' voices; he left operatic music restored to its original purpose of expressing musically the meaning of the words to which it was composed, and of emphasizing the dramatic situation. Consult: Marx, *Gluck und die Oper* (Berlin, 1863); Ferris, *Great Musical Composers* (New York, 1887); Newman, *Gluck and the Opera* (London, 1895); Reissmann, *Christoph Willibald von Gluck* (Berlin and Leipzig, 1882).

GLÜCKSTADT, glük'stät. A town in the Prussian Province of Schleswig-Holstein, on the Elbe, 32 miles below Hamburg (Map: Prussia, C 2). It is a pretty town, regularly built, and intersected by canals. It has a gymnasium, railway repair-shops, ship-yards, manufactures of furniture, wagons, mirrors, soaps, shoes, cigars, etc. The fisheries are important. When the Elbe is ice-bound the harbor receives much of the Hamburg shipping. It is very commodious and admits the largest vessels. Glückstadt was founded in 1620 by Christian IV. of Denmark, fortified, and endowed with various commercial privileges. During the Thirty Years' War it successfully withstood three sieges; its fortifications were demolished in 1815. Population, in 1890, 5958; in 1900, 6586.

GLUCOSE (from Gk. γλυκός, *glykys*, sweet), **DEXTRO-GLUCOSE**, **DEXTROSE**, **GRAPE-SUGAR**, or **DIABETIC SUGAR**. One of the carbohydrates that are represented by the formula $C_6H_{12}O_6$. As ordinarily obtained, the crystals of dextro-glucose include one molecule of water for every molecule of the carbohydrate, and are therefore represented by the formula $C_6H_{12}O_6 + H_2O$. It occurs naturally in fruits (notably in grapes, cherries, bananas, apples, pears, plums, etc.) and other vegetable tissues, usually in mixtures with other carbohydrates, among the more important of which are fruit-sugar (also called levulose and dextro-fructose), cane-sugar, and starch. It may often be observed in the crystalline state on raisins and figs, and in 'candied' honey, of which it is also a constituent. It also occurs in plants in combination with organic acids, the compounds, called 'glucosides,' including the well-known salicin of the willow and amygdalin of bitter almonds. Glucose is one of the early products of photosynthesis (q.v.) in plants, in which it is formed from carbon dioxide and water, probably by the condensation of formaldehyde with the liberation of oxygen. As a food it is freely utilized by the plant producing it for the formation of more complex sugars, other carbohydrates, and proteids. It may be accumulated as a reserve in many fruits, e.g. the grape. Glucose is one of the best foods for fungi and has even been fed successfully to some seed-plants, e.g. corn, which in the absence of other foods can use it in producing starch. In the animal kingdom, grape-sugar is found sometimes as a normal and sometimes as a pathological constituent of various fluids and tissues. Thus, it occurs normally in the contents of the small intestine, and in the chyle after the use of amylaceous and saccharine foods, in the blood of the hepatic veins (see LIVER), in the tissue of the liver, in both the yolk and white

of birds' eggs, in the urinary secretion in minute quantity, etc. In diabetes, it exists in large quantity in the urinary secretion, and may be detected in nearly all the fluids of the body. The statement is frequently found in the older treatises on chemistry and medicine that grape-sugar is produced by the action of ptyalin and pancreatin on starch; but later researches have shown that the principal products of the action of these enzymes on starch are dextrin and maltose, intermediate products which are changed to glucose when treated with acids. (See further below.)

Dextro-glucose seldom occurs in distinct, well-formed crystals, but may be obtained in warty masses which, when examined under the microscope, are found to consist of minute six-sided tablets. It is white when pure, melts at from 80° to 100° C. (176°-212° F.), depending upon the manner of heating and the consequent rapidity with which it parts with its water of crystallization. At higher temperatures (above 200° C.) it loses its sweetness and passes into a brown unfermentable substance called caramel, which is soluble in water and has a bitter taste. This substance is prepared on a large scale from commercial glucose and, under the name of 'burnt sugar,' 'sugar-color,' or 'starch sugar-color,' is used for coloring foods, confectionery, liquors, etc. Grape-sugar is less sweet than ordinary cane-sugar. (See SUGARS.) Its relative sweetening power has been variously estimated at one-half to three-fifths that of cane-sugar. It is very soluble in water, but is only slightly soluble in strong alcohol. One of the most important properties of grape-sugar is its capacity for undergoing fermentation under the action of the yeast-plant. It is upon this property that the use of yeast depends in the manufacture of alcohol, distilled liquors, beer and other malt liquors, wines, and bread. In these processes grape-sugar is decomposed into alcohol and carbonic-acid gas, according to the following equation:

The power of decomposing grape-sugar and other carbohydrates is possessed by a number of species of the lower forms of vegetable life, the decomposition products varying greatly with the species and the conditions. The action of bacteria on sugars and other carbohydrates has been found to be a very valuable means of identifying a number of species of these microscopic organisms. For example, one species transforms grape-sugar into lactic acid, from which the subsequent or simultaneous intervention of another species of bacteria, butyric acid, may be obtained. Grape-sugar itself is produced by the hydrolysis of a number of carbohydrates which have more complex molecular structure. These changes, which consist in the splitting up of the more complex molecules with the simultaneous absorption of water, may be brought about by hot dilute acids or by contact with certain enzymes (q.v.). Cane-sugar is 'inverted' by treatment with dilute acids (see CATALYTIC ACTION), or by invertin (an enzyme produced by the yeast-plant), the product of the reaction, which is a mixture of equal parts of grape-sugar and fruit-sugar, known as 'invert sugar':

Milk-sugar, or lactose, is changed by dilute acids into grape-sugar and galactose; and raffinose ($C_{15}H_{32}O_{16}$) yields three different substances when treated with dilute acids, namely, grape-sugar, fruit-sugar, and galactose. When maltose and dextrin are treated with dilute acids, grape-sugar is the sole product.

Chemically, dextro-glucose is one of the so-called 'aldo-hexoses' (see SUGARS), its molecule containing one aldehyde group (CHO), four secondary alcohol groups (CHOH), and one primary alcohol group (CH_2OH). The synthesis of dextro-glucose was perfected in 1890, by Emil Fischer, who showed the structure of its molecule to be represented by the following graphic formula:

Dextro-glucose

COMMERCIAL GLUCOSE. The term glucose is also applied to mixtures of the substance described above with other carbohydrates, the various mixed products being otherwise called 'starch-syrup,' 'corn-syrup,' 'starch-sugar,' 'corn-sugar,' etc. Starch is the favorite material for the manufacture of commercial glucoses. Potato-starch is largely used for this purpose in Europe; in this country corn-starch is at present practically the only commercially possible raw material. The manufacture of corn-starch and the conversion of it into glucose are generally conducted in the same establishment, the two processes together constituting a very large industry. It was estimated in 1898 that the glucose industry of the United States annually consumes approximately 35,000,000 bushels of corn. In 1884 6,773,115 pounds of glucose and grape-sugar, valued at \$212,028, were exported by the United States; while during the fiscal year ending June 30, 1901, the exports of these commodities amounted to 204,209,974 pounds, valued at \$3,113,898.

For the manufacture of glucose from corn, the grain is first softened by treatment, for two or three days, with water containing a small percentage of sulphurous acid; then coarsely ground; and then treated with 'starch-milk' (a mixture of starch and water) of such a density that the lighter embryos, or 'germs,' float on the surface, whence they are removed, while the heavier parts of the kernels sink to the bottom of the liquid. The 'germs' are dried and sold for stock-feed after the extraction by hydraulic pressure of the oil they contain. This oil is found in commerce under the name of corn-oil or maize-oil. The parts of the kernel that sink are finely ground. The starch is thus set free so that it can be separated from the ground grain by washing on sieves. It is afterwards purified by successive mixing with water and sedimentation, or by deposition on 'starch-tables,' over which the washings from the sieves are allowed to flow. The starch, which is much heavier than water and the impurities from which it is to be freed,

collects at the bottom of the settling-vats in a hard white layer which, when drained, is called 'green starch' and is ready for conversion into glucose. The residue retained by the sieves and the nitrogenous matter, as well as the small amount of starch left in the wash waters, are collected, pressed, dried, and sold for stock-feed. See GLUTEN MEAL AND GLUTEN FEED.

For converting the starch into glucose (hydrolysis), hydrochloric acid is now very generally used, although for certain products sulphuric acid in mixture with a minute quantity of nitric acid is used. The operation is conducted in steam heated, closed copper 'converters,' under a pressure of two or three atmospheres (30 to 45 pounds per square inch). This high pressure greatly lessens the quantity of acid and the time necessary. In the case of sulphuric acid, from one to three pounds are used per 100 pounds of dry starch; in the case of hydrochloric acid, only one-half to three-quarters of a pound of the concentrated acid is necessary. The starch is mixed with a considerable quantity of water before the acid is added; the time required for the conversion varies from 10 to 30 minutes, according to the character of the required product, the time being much longer for solid starch-sugar than for syrupy glucose. By the action of the acid, the starch is first converted into dextrin and maltose; by continued treatment, these bodies are changed to grape-sugar. The syrupy products contain in some cases as much dextrin as grape-sugar, and a very large percentage of maltose, while in some of the dry products only traces of dextrin and maltose are found. As the liquor comes from the 'converter,' the acid is neutralized with chalk or marble dust, if sulphuric acid is used, or with soda if hydrochloric acid is used. In the former case, the gypsum or sulphate of lime formed crystallizes out, and is separated by filtration; in the case of hydrochloric acid, the neutralization product is sodium chloride (common salt), of which the quantity is so small that it does not injure the quality of the finished product. The neutralized liquid is decolorized by filtration through boneblack, and concentrated in vacuum evaporators to form a syrupy or a dry product, as may be desired.

Among the products of glucose factories, those of greatest commercial importance are 'mixing glucose,' used by syrup and molasses manipulators; 'jelly glucose,' used in making jellies from evaporated apple-juice and other materials; 'confectioners' glucose'; 'brewers' glucose,' used as a substitute for malt in brewing; and 'anhydrous starch-sugar.' Well-made glucoses must be regarded as a perfectly wholesome product, as they are composed of substances of frequent and abundant occurrence in foods that have been in use from time immemorial, and which are similar to the products into which starch is normally transformed by the processes of digestion. The objection to their use in the preparation of foods lies mainly in the fact that the consumer is frequently misled in regard to the value of the commodities containing them, and that they are frequently used in the fabrication of inferior, artificial or highly diluted, or otherwise adulterated goods.

Consult: Wagner, *A Practical Treatise on the Manufacture of Starch, Glucose, Starch-Sugar, and Dextrin*, translated by Frankel and Hutton

(Philadelphia, 1881); Hallock, *Bibliography of Starch-Sugar* (Washington, D. C., 1884).

GLUCOSIDE. A name applied to a number of organic substances occurring abundantly in plants. Chemically they are compounds of various sugars (usually grape-sugar) with organic acids, and they readily split up into their constituents under the action of acids, alkalies, or certain ferments. Thus, *amygdalin*, $C_{20}H_{27}NO_{11}$, a glucoside found in bitter almonds and other vegetable products, is decomposed by the ferment named emulsion into dextrose (a sugar), benzaldehyde, and hydrocyanic acid. (See ALMONDS, VOLATILE OIL OF.) Again, *myronic acid*, $C_{10}H_{16}NS_2O_{10}$, a glucoside found in black mustard, is decomposed by baryta water, or by the action of the ferment named myrosin, into glucose, allyl,

mal yield the better glue. Fish glue is made from the skin, scales, and muscular tissue of some of the larger fish, and is, of course, a very different product from true isinglass (q.v.). In its adhesive powers it resembles hide glue, but it retains an offensive odor. The raw material of most glue-factories is chiefly composed of the waste from slaughter-houses and from leather-manufactories—the trimmings of hides and bones, and scraps of leather or pieces of old leather which was cured by some other process than tanning. Glue, however, cannot be made from material in which the slightest trace of tannic acid remains.

The accompanying statistics regarding the manufacture of glue in the United States are taken from the United States Census of 1900:

	Total number of pounds	Made from hide, trimmings, etc., fur, or neat's-foot stock	Made from bone or bone liquor
		Pounds	Pounds
Glue establishments.....	34,984,448	29,036,901	3,109,165
Slaughtering establishments.....	34,516,761	12,780,832	20,183,562
United States.....	69,501,209	41,817,733	23,292,727
		Made from cattle, hogs, etc.	Made from fish skins and waste
		Pounds	Pounds
Glue establishments.....	66,666	2,731,156	40,560
Slaughtering establishments.....	1,282,367	270,000
United States.....	1,349,033	3,001,156	40,560

The value of imports of hide cuttings, raw, and all other glue stock and hide rope entered for consumption in the United States during the fiscal year of 1899-1900, was \$1,207,572.03, and the value of imports of glue was \$526,544.05.

iso-sulphocyanate, and acid potassium sulphate. Another well-known glucoside is *quercitrin*, $C_{20}H_{30}O_{20}$, which occurs in the bark of the *Quercus tinctoria* and is used as a yellow dye. The glucoside *convolvulin* $C_{21}H_{36}O_{16}$, which is found in jalap-roots, acts as a strong purgative. The *tannins* are glucosides of aromatic acids. Many of the glucosides have been reproduced artificially, and, their chemical constitution being fairly well known, have been distributed among the several classes of carbon compounds to which they naturally belong. Those glucosides, however, whose constitution is as yet unknown, or but imperfectly known, are still generally grouped together.

GLUE (from OF. *glu*, bird-lime, from Lat. *glus*, glue; connected with Gk. *γλοιος*, *gloios*, glue, Eng. *clay*). An inferior grade of gelatin, prepared, on account of its adhesive qualities, for use in the arts and industries, and particularly in the various branches of wood-working. A preparation of glue or other gelatinous material for glazing the surface of a textile fabric, paper, or other material is known as 'size.' With the development of the textile, paper, and allied industries, the use of glue as sizing has enormously increased the demand for this article and its consequent commercial importance. The best glue-making material is the corium or true skin of the animal, that portion, lying beneath the epidermis and inner layer of fat, which is also used for the manufacture of leather. The glue extracted from the bones of animals is inferior in adhesive qualities. The softer bones of an ani-

The method of glue manufacture varies with the character of the material employed. In making glue from hide, the scraps are first limed, to facilitate the removal of adhering hair, flesh, and fat, as in the manufacture of leather (q.v.). This process requires from ten to forty days, after which the skins are washed and dried. Instead of lime, caustic soda or sulphurous acid is sometimes used for cleansing the glue stock. The prepared stock is converted into glue by the application of heat. By an older method, the pieces are placed in flat-bottomed copper boilers, which have a perforated false bottom placed a little above the true one, to prevent the burning of the materials. The whole is kept at a gentle boiling heat until the gelatinous part has boiled out, and the mass of the material has sunk down into the fluid. The boiler is at first filled with soft water for two-thirds of its depth. The boiling is sustained until, by repeated trials of small quantities, the operator knows the fluid to be of the right consistency, when it is drawn off to the congealing-boxes: a fresh lot of material is often added to the residue left in the boiler, and the process is repeated. Recently, the use of steam, either indirectly in closed pipes or directly in perforated pipes, or else blown under high pressure directly into the closed vessel containing the mixture, has been found to expedite the process and improve the quality of the glue. After boiling, the glue is allowed to settle, or is strained through linen bags to free it from impurities. The waste thus recovered, consisting of fat, hair, and other matter, is utilized in the

manufacture of fertilizers, while the glue itself is subjected to a process of drying. Drying is likely to prove a troublesome process, requiring great care, as the glue readily spoils at this stage. Until recently, drying was accomplished in the open air, but the more recent practice is to place the glue in specially prepared drying-rooms where the temperature and humidity can be carefully regulated. The glue is dried in shallow wooden molds. Thence it is removed to a smooth-topped table, whose surface has been moistened to prevent sticking, and here it is cut, by means of wires, into pieces of the desired shape and size. Fish glue is made by a similar process.

Bone glue is extracted by boiling the bones, which have been previously treated with a solution of hydrochloric acid, to remove the calcium phosphate. The powdered bones are kept in a solution of dilute hydrochloric acid for several days. They are then allowed to stand in lime-water for a few hours, after which the gelatin is extracted by means of boiling water or steam, as in the preparation of hide glue. The calcium phosphate recovered from the bones is used as fertilizing material, and the fat is also utilized.

Liquid glue is prepared from a solution of dried glue by the action of nitric or acetic acid, which checks its tendency to gelatinize without diminishing its adhesive qualities. An excellent liquid glue may be made by mixing four parts of transparent gelatin, four parts of strong vinegar, one part of alcohol, and a small amount of alum.

GLUE, MARINE. A waterproof cement made by dissolving one part of finely divided india-rubber in 12 parts of naphtha or benzine, then adding 20 parts of powdered shellac, and digesting at a gentle heat until the shellac is dissolved. The fused mass, while still hot, is poured on plates of metal or stone, so as to form thin sheets. For use, it is liquefied by heating, and is then applied with a brush. Owing to its property of resisting moisture, it is much used in ship-building, to unite surfaces exposed to water; and it is also valuable as a cement for glass, metal, and stone.

GLUGÆ'A BOMBYCIS. A parasite of the silkworm, which formerly did immense injury to the silk industry of France.

GLUKHOV, глѣховъ. The capital of a district of the same name in the Russian Government of Tchernigov, situated on the Yesmana, 180 miles south-southeast of Tchernigov (Map: Russia, D 4). The chief occupation is agriculture; the trade is insignificant. The town existed as early as the twelfth century, and passed to Lithuania in the fourteenth century, and later to Poland. It was the seat of the hetmans of Little Russia. Population, in 1889, 16,969; in 1897, 14,856.

GLUMDAL/CA. A captive Brobdingnagian Queen at Arthur's court, in Fielding's burlesque *Tom Thumb*. The much-married King Arthur is attracted to her, but Tom Thumb is the master of her heart.

GLUMDAL/GLITCH. A maiden giantess of Brobdingnag, nine years old and forty feet high, in Swift's *Gulliver's Travels*. She becomes deeply attached to her pigmy ward, but her attentions often threaten the safety of his life and limbs.

GLUME, glōom (Lat. *gluma*, husk, from *glubere*, to peel, Gk. γλύφειν, *glyphein*, to carve). The characteristic bract which distinguishes the inflorescence of grasses, which on this account are often spoken of as 'glumaceous plants.' See GRAMINEÆ.

GLÜMER, glü'mër, ADOLF VON (1814-96). A German soldier. He was born at Lengefeld, and after receiving a military education, entered the Prussian Army, in which he won rapid promotion, and participated in the Austro-Prussian War of 1866. In the Franco-German War he especially distinguished himself, serving as a division commander at Spichern, Forbach, Gravelotte, and Metz. He also took a prominent part in the battle around Belfort.

GLÜMER, CLAIRE VON (1825—). A German author, born at Blankenburg, in the Harz Mountains, and educated chiefly in France. Her translations of English, French, and Russian authors include various works of Swift, Lanfrey, Daudet, Feuillet, George Sand, Turgenieff, Tolstoy, and others. Her original productions include novels and romances such as: *Düstere Mächte* (1870); *Tom Webstuhl der Zeit* (1882); *Junge Herzen* (1890); *Es giebt ein Glück* (1897).

GLUTEN (Lat., glue). One of the most important constituents of the varieties of corn used as food. It is obtained by mixing flour with water, and thus forming a paste or dough. This paste is placed in a bag of fine linen, and kneaded in water, which must be repeatedly changed, till it ceases to assume a milky appearance. A gray, tenacious, viscous, tasteless substance, having the appearance of bird-lime, is left in the bag. This substance consists mainly of gluten, mixed with traces of bran starch and of oily matter. The gluten thus obtained from wheat and from rye is far more tenacious than that which is obtained from the other cereals, and it is the great tenacity of this constituent that especially fits these flours for conversion into bread. It is found, by analysis, that the proportion of gluten contained in wheat grown in hot countries is considerably higher than in wheat grown in colder countries; and the hard, thin-skinned wheats contain more of this ingredient than the softer varieties of the grain. Gluten in a moist state rapidly putrefies, the mass acquiring the smell of decaying cheese; but when dry, it forms a hard, brownish, horny-looking mass, that does not very readily decompose. On treating gluten with hot alcohol, it resolves itself into at least two distinct substances, one of which is soluble, and the other insoluble in that fluid. The insoluble portion is vegetable fibrin. It is a gray, tough, elastic substance, insoluble in water or in ether, but readily soluble in dilute alkalies, from which it is precipitated by neutralization with acetic acid. It is also soluble in very dilute hydrochloric acid, from which it is thrown down by the neutral salts. The soluble portion is in part precipitated from the alcohol on cooling, in the form of flakes, which have the composition and properties of casein; while a third substance, known as *gliodin*, remains in solution, giving to the alcohol a syrupy consistence. It separates, on the addition of water, as a white substance resembling albumen. All these constituents of gluten contain carbon, hydrogen, nitrogen, oxygen, and sulphur, in much the same proportion as the proteids, and they all doubtless belong to the

flesh-forming group of foods. The action of gluten in the manufacture of bread is probably a double one; it induces, by constant action, an alteration of the starch, and subsequent fermentation, while by its tenacity it prevents the escape of carbonic-acid gas.

The large quantities of gluten obtained as a by-product in the manufacture of starch are at present utilized for the manufacture of certain articles of food.

GLUTEN MEAL AND GLUTEN FEED.

By-products resulting in the manufacture of starch or glucose from the starch of the corn-kernel. Their principal use is as a feeding stuff for farm animals. The by-product differs greatly in composition according to the process of manufacture which is followed. Gluten feed is the entire residue of the kernel, including the germs and hulls. Gluten meal, cream gluten, and similar materials sold under a variety of trade names, do not contain the corn-hulls. Some factories extract a part of the fat from the gluten meal; others mix the gluten meal with the hulls and germs, without extracting the fat, and sell it as gluten feed. The dried products from the same factory vary considerably in composition from time to time, so that although a very large number of samples of gluten meal and feed have been analyzed by the experiment stations, no very reliable figures can be given for percentage composition. In general, the gluten meals are richer than the gluten feeds. These meals contain from 20 to 40 per cent. of protein, the average being about 30 per cent., and from 6 to 20 per cent. of fat, with an average of nearly 12 per cent. The carbohydrates constitute about 45 per cent., and the fibre varies with the completeness of the separation of the hulls, rarely amounting to over three or four per cent. The gluten feeds usually contain about 24 or 25 per cent. of protein, although the product from some factories has been below 20 per cent., and of others over 30 per cent. The fat varies less than in gluten meal, averaging about 10 per cent.; and the carbohydrates are higher, averaging over 50 per cent. Like other corn products, none of these materials contain much ash—less than 1 per cent. usually.

Gluten meal and feed are both quite digestible, from 85 to 90 per cent. of the protein, 90 to 95 per cent. of carbohydrates, and 85 to 95 per cent. of the fat being digested by ruminants. They are highly prized as feeding stuffs, especially for dairy cows, and are now very extensively used over the northeastern part of the United States. Gluten meals, when fed to cows in considerable quantity, cause a slight softening of the butter, but give a product of good quality. Gluten meal is also a satisfactory feed for fattening steers, and for pigs.

GLUT HERRING. A 'river-herring' (*Clupea astivalis*), closely related and similar to the alewife, and often confused with it in the market, although considered inferior. It is more commonly known on the New England coast as 'blueback.'

GLUTTON. The English name for the European representatives of the circumpolar carnivore known in North America as the wolverine (*Gulo luscus*). The fables to which it owes its name, and the equivalents in all European languages, are sketched and considered by Dr. Elliott Coues in his *Fur-Bearing Animals* (Wash-

ington, 1877). In the early books about animals this denizen of forests, popularly supposed to be more or less filled with hobgoblins anyhow, was represented as a ravenous monster of insatiate voracity, matchless strength, and supernatural cunning. For the real character of the animal whose name perpetuates these foolish calumnies, the reader is referred to the article **WOLVERINE**, and the Plate of **FUR-BEARING ANIMALS**.

GLYCE'RIA. See MANNA GRASS.

GLYCERIN, glis'ēr-in, **GLYCEROL** (from Gk. γλυκερός, *glykeros*, sweet, from γλυκίς, *glykys*, sweet), or **PROPENYL ALCOHOL**, $C_3H_8(OH)_3$. An organic chemical compound, used for a variety of purposes in the arts and in medicine. Perfectly pure glycerin is a crystalline solid substance melting at 17° C.; but the merest traces of impurities prevent it from crystallizing, and it is therefore usually obtained in the form of a thick syrupy liquid that boils at 290° C. Small quantities of salts cause it to decompose to some extent when distilled. Glycerin mixes in all proportions with water and alcohol, and readily absorbs moisture if exposed to the air, but does not mix with ether, chloroform, carbon disulphide, benzene, and many other organic liquids. On the other hand, it forms an excellent solvent for a variety of substances, both inorganic and organic. It is colorless and odorless, but has a distinctly sweet taste. Its specific gravity at 15° C. is 1.265. Glycerin is obtained in large quantities in the manufacture of soap and of candles. It is well known that natural fats are largely used in the manufacture of these products, and as fats consist mainly of glycerides, i.e. compounds of glycerin with fatty acids, glycerin is set free when the fats are decomposed, or 'saponified.' It is thus obtained, in more or less dilute aqueous solution, through the saponification of fats with lime or with superheated steam. To separate the glycerin from the dilute solution, the latter is somewhat concentrated by evaporation, filtered through boneblack, and then further evaporated *in vacuo*. To render it fit for use in medicine and in the manufacture of nitroglycerin, the product thus obtained is further purified by distillation with superheated steam before it is brought into the market. Finally, to eliminate, for scientific purposes, the last traces of impurities in the commercial product, the latter may be again mixed with water, filtered through carefully purified boneblack, and evaporated *in vacuo*. In medicine glycerin is used chiefly as a vehicle for applying externally many substances, such as the alkalies, neutral salts, bromine, iodine, alkaloids, tannic acid, etc.. the glycerin solutions of which are readily absorbed by the skin. If injected into the rectum, glycerin relieves constipation, its action being speedy, painless, and followed by no constitutional disturbance. Very large doses of glycerin taken internally are liable to cause loss of muscular strength, lethargy, and even death. In the arts, glycerin is employed mainly in the manufacture of nitroglycerin, from which many valuable modern explosives are made; nitroglycerin is the tri-nitrate of glycerin, $C_3H_5(ONO_2)_3$, obtained by the action of nitric acid on glycerin. Glycerin is further used as a preservative fluid for small and delicate anatomical preparations, and has been applied to the preservation of meat and other foods; it has been added to the water in gas-meters, with the

view of preventing it from freezing in winter and from evaporating too rapidly in summer. It is also used in the manufacture of toilet-soap, of parchment paper, and of printers' rollers, in the textile industry, etc.

Chemically glycerin is a tri-atomic alcohol, its constitutional formula being $\text{CH}_2(\text{OH})\cdot\text{CH}(\text{OH})\cdot\text{CH}_2(\text{OH})$. When the hydrogen of its hydroxyl groups is replaced by metals or by organic acid radicles, alcoholates or esters, respectively, are obtained. Fats are mixtures containing, in various proportions, mainly the esters which glycerin forms with oleic, palmitic, and stearic acids. The hydroxyl groups of glycerin may be readily replaced by chlorine or bromine, one or two atoms of chlorine being thus substituted by the direct action of hydrochloric acid, while the third hydroxyl group may be replaced by chlorine by the action of phosphorus pentachloride. Besides the method described above, by which glycerin is made on an industrial scale, it may be prepared by the action of potassium permanganate on allyl alcohol, and it is produced in small quantities during the alcoholic fermentation of sugars. By the action of acid potassium sulphate or other dehydrating agents on glycerin, or simply by distilling impure glycerin under ordinary atmospheric pressure, acrolein is produced according to the following chemical equation:

When carefully oxidized with dilute nitric acid, glycerin is transformed into glyceric acid, $\text{CH}_2(\text{OH})\cdot\text{CH}(\text{OH})\cdot\text{COOH}$. Usually, however, the products of oxidation of glycerin are oxalic, carbonic, and glycollic acids.

Glycerin was discovered by Scheele in 1779; Chevreul demonstrated its existence, in the form of glycerides, in the fats; its composition was determined by Pelouze, and its chemical constitution by Berthelot and Wurtz. Finally, Charles Friedel, in collaboration with Silva, succeeded in effecting the complete synthesis of glycerin from its chemical elements; their method, however, is too complicated to be described here.

GLYCIN (from Gk. γλυκίς, *glykys*, sweet), GLYCOCINE, GLYCOCOLL, SUGAR OF GELATIN, or AMIDO-ACETIC ACID, $\text{CH}_2(\text{NH}_2)\text{COOH}$. An organic chemical compound of carbon, hydrogen, oxygen, and nitrogen. It occurs in colorless, transparent, rhombic prisms, which have a sweet taste, and are devoid of odor. It is very soluble in water, but is insoluble in alcohol and in ether. Glycin combines both with acids (as hydrochloric, nitric, sulphuric, and oxalic acid) and with metallic oxides, and the compounds in both cases are soluble and crystallizable; they are, however, of no great importance. Glycin is usually prepared by subjecting hippuric acid to prolonged boiling with hydrochloric acid, benzoic acid being produced at the same time. It is also sometimes prepared synthetically, by the action of ammonia upon mono-chlor-acetic acid, according to the following chemical equation:

Glycin exists in the animal body only in combination; it is one of the chemical components

of hippuric acid and glycolic acid, two substances of considerable physiological importance. It is, further, one of the products obtained by boiling gelatin with acids or with alkalies, and is produced also when uric acid is subjected to the action of hydriodic acid.

GLYCOCINE. See GLYCIN.

GLYCOCOLL. See GLYCIN.

GLYCOGEN (from Gk. γλυκίς, *glykys*, sweet + -γενής, -*genēs*, producing, from γίγνεσθαι, *gignesthai*, to be born), or ANIMAL STARCH, $(\text{C}_6\text{H}_{10}\text{O}_5)_n$. An organic substance found in considerable quantities in the liver, in muscles, in white blood-corpuscles and pus-corpuscles in the body of mammals, and even in larger quantities in many mollusks, including the common oyster. It is a carbohydrate extremely similar to vegetable starch. Pure glycogen is an amorphous white powder, readily dissolving in water and reprecipitated from its aqueous solution by the addition of alcohol and of a trace of common salt. It may be prepared from the liver of a dog to which considerable amounts of carbohydrate food have been given: the liver is cut into small pieces and boiled with water; the liquid thus obtained is acidified for the purpose of separating the soluble proteid matter, and on filtering and cooling glycogen is precipitated with an excess of strong alcohol; it is purified by washing with alcohol and ether. When heated with dilute mineral acids, glycogen is like starch gradually and completely transformed into dextrose. By the action of saliva, glycogen is transformed into dextrin and a sugar. The hepatic cells of the liver convert glycogen into sugar. The uses of glycogen in the animal economy are noticed in the article LIVER (q.v.).

GLYCOL (from *glyc-erin* + *alcoh-ol*), or, more properly, ETHYLENE GLYCOL, $\text{C}_2\text{H}_4(\text{OH})_2$. A thick liquid, having a sweet taste, and boiling at 197.5°C . It cannot be mixed with ether, but mixes in all proportions with water and ordinary alcohol. It may be prepared by heating ethylene di-bromide with an aqueous solution of potassium carbonate, evaporating the resulting solution at a gentle heat, extracting the semi-solid residue with a mixture of alcohol and ether, and subjecting the solution thus obtained to fractional distillation. Ethylene glycol is the simplest substance of the group of glycols, or di-atomic alcohols, a general description of which may be found under ALCOHOLS. A detailed account of the glycols was given by their discoverer, Adolphe Wurtz, in a lecture delivered before the Chemical Society of Paris. Consult Pasteur, Cahours, Wurtz, etc., *Leçons de chimie professées en 1860* (Paris, 1861).

GLYCON (Lat., from Gk. Γλύκων, *Glykōn*). An Athenian sculptor, who lived probably in the first century B.C. He executed the celebrated colossal marble statue of the Farnese Hercules, discovered in the baths of Caracalla in 1540. After adorning the Farnese Palace for some time, it was removed to the Royal Museum at Naples. It represents the hero resting on his club after one of his labors, and is supposed to have been copied from the Heracles of Lysippus. No ancient writer mentions Glycon, but ΓΛΥΚΩΝ ΑΘΗΝΑΙΟΣ ΕΠΟΙΕΙ ('Glycon, the Athenian, made it') is engraved on the rock which supported the statue. Consult Brunn, *Geschichte der griechischen Künstler* (Brunswick, 1853).

GLY'COSU'RIA (Neo-Lat., from Gk. γλυκύς, *glykys*, sweet + ὄσρον, *ouron*, urine). A symptom of diabetes mellitus. See **DIABETES**.

GLYKAS, MICHAEL. A Byzantine historian. Little is known of his life. His *History of the World*, from the earliest times to 1118, is a valuable work of reference, and contains many interesting references to theological and other matters. The best edition of the work was published by Bekker (Bonn Collection, 1836). Glykas is said to have been imprisoned and condemned to death about the middle of the twelfth century. A poem, containing nearly 600 verses, addressed to the Emperor Manuel Comnenus, is valuable as one of the earliest examples of vulgar Greek.

GLYNN, JOHN (1722-79). An English politician and lawyer. He studied at Oxford, but got no degree. Called to the bar in 1748, he soon became famous for his wide knowledge of law and for his radical position in politics. This combination made him a valuable friend and adviser of John Wilkes, for whom Glynn acted in many cases. In 1772 he was counsel for an alderman named Townsend in a suit against a land tax, in which he urged the nullity of Parliament on the ground of irregular elections. In 1768 he was elected to Parliament after an exciting campaign, marked by much violence and corruption; in the next year he presented the Middlesex petition, and in 1770 urged a committee to inquire into cases in regard to the press.

GLYNNE, Sir JOHN (1603-66). An English jurist and Parliamentarian. He was born at Glynllifon, Carnarvonshire, and was educated at Westminster School and Oxford. Called to the bar in 1628, by 1639 he was a leading member of the famous Long Parliament, and shared in the impeachment of Strafford. He was recorder of the City of London for six years (1643-49), and retired on an annual pension of £300. Though a stout adherent of Cromwell, and a most able prosecutor of his would-be assassins, Glynn was no republican, and urged the Protector to call himself King. After the Restoration he devoted his great abilities as judge and advocate to the service of Charles II., bringing to trial some of his former associates. But he was no ordinary turncoat, and remained true throughout to the Presbyterian party.

GLYPTICS. The art of engraving, particularly as applied to the carving of precious stones. It is now generally performed by means of diamond-dust and diamond-pointed instruments. In addition to gems, the engraving of various substances, such as coral and ivory, and unusually hard woods, such as box and ebony, is included under this head. See **ENGRAVING**; **GEMS**; **CUNEIFORM INSCRIPTIONS**.

GLYPTODON (Neo-Lat., from Gk. γλυπτός, *glyptos*, carved + ὀδούς, *odous*, tooth, in allusion to the sculptured grinding surface of the teeth). A gigantic extinct edentate mammal allied to the armadillo, and of which fossil remains are found in the Pleistocene deposits of South America, and less commonly in Mexico, Texas, and Florida. The animal had a solid carapace made up of mostly hexagonal plates arranged in transverse rows, like those of the armadillo, but solidly united, so that the creature was unable to curl up.

These bony plates were often ornamented by grooves or tubercles, and were covered by horny epidermal scales. The tail also was encased in a sheath of strongly nodular bony plates. The head likewise had, in some species, a coat of mail of small plates. The skull is high, narrow, and short, with a peculiar long process descending from the zygomatic arch. Both the jaws have eight molar teeth on each side, each of which is divided into three vertical prisms by two deep lateral grooves, and the form of the crown sculpturing is very peculiar. The legs are heavily built, the feet large, and the fingers are short, and armed with thick hoof-like claws. The latter character shows that the animal could not have been a burrower like the armadillo. The best-known species is *Glyptodon clavipes* of the Pleistocene beds of Argentina, which attained a length over all of about seventeen feet. An allied genus is *Dædicurus*, of even larger size than *Glyptodon*, with a smooth carapace pierced by many cavities, and a longer tail formed of five or perhaps six movable rings, terminated by a club-shaped tube, which seems to have borne movable spines or bosses at its extremity.

Consult Lydekker, "The Extinct Edentates of Argentina," in *Anales de Museo de la Plata, Paleontologia Argentina*, vol. iii., part ii. (La Plata, 1894). See **EDENTATA**.

GLYPTOTHE'CA, or **GLYPTOTHEK'** (Ger., from Gr. γλυπτός, *glyptos*, carved + θήκη, *thêkê*, chest). A building or room for the preservation of sculpture. Such buildings were common in ancient times. Cicero gives a minute description of one. The most famous modern gallery of sculpture called by this name is the Glyptothek in Munich (q.v.).

GMELIN, gma'lén, CHRISTIAN GOTTLÖB (1792-1860). A German chemist, born in Tübingen. His discovery of the artificial preparation of ultramarine was highly important in its bearing on manufacturing industry. His principal work is entitled *Einleitung in die Chemie* (1833-37).

GMELIN, JOHANN GEORG (1709-55). A German botanist. He was born in Tübingen, was educated in the university there, and in 1731 became professor of chemistry and natural history at Saint Petersburg. In 1733, by order of the Empress Anne, he joined Deslisle, G. F. Müller, and Bering in an expedition for the exploration of Siberia, which country they penetrated as far as the Lena. He returned to Saint Petersburg in 1743. In 1749 he was chosen professor of botany and chemistry at Tübingen. He published *Flora Sibirica* (1747-69) and *Reise durch Sibirien* (1751-52). Linnæus named a genus of plants *Gmelina* in his honor.

GMELIN, LEOPOLD (1788-1853). A German chemist. For several generations members of the Gmelin family have distinguished themselves in science. Leopold's father, Johann Friedrich, held professorships of natural history and medicine at Tübingen and Göttingen. Leopold was professor of medicine and chemistry at Heidelberg from 1817 to 1851. In 1820 he undertook, in conjunction with Tiedemann, a series of experiments on digestion, and in 1826 they published their celebrated work on the subject, in two volumes, under the title *Die Verdauung*. Gmelin is famous chiefly, however, for his admi-

rable and elaborate *Handbook of Chemistry* (1817-19), which was subsequently revised and enlarged by Kraut; Gmelin-Kraut's *Handbuch* is well known to every student of chemistry. An English translation of the work (under the auspices of the Cavendish Society), with important additions by Watts, the translator, was published in the course of 1848-59. Consult obituary in the *Journal of the Chemical Society* (London, 1855).

GMELIN, SAMUEL GOTTLIEB (1744-74). A German botanist and traveler, nephew of J. G. Gmelin. He was born in Tübingen, graduated there in 1763, went to Saint Petersburg in 1767, and in 1768, with Gölldenstadt and Lapuchin, entered on a journey for the scientific exploration of the southeastern possessions of Russia. When on his way back to Saint Petersburg he was seized as a hostage by Usmei Khan, of the Kaitak tribe, as a result of whose ill-treatment he died. He published: *Historia Fucorum* (1768); *Reisen durch Russland* (1771-84); and other works.

GMElina, mēl't-ná or mē-l'na (Neo-Lat., named in honor of the German traveler J. G. Gmelin, 1709-55). A genus of trees of the order Verbenaceæ, with heart-shaped leaves and panicles of flowers consisting of a small four or five toothed calyx, and a large obliquely bell-shaped corolla. *Gmelina arborea*, called goombar or koombar in Hindustan and the Eastern Peninsula, where it is widely distributed and attains a great size, is valuable for its timber, which resembles oak, but is closer in grain and lighter. It is used for many purposes, such as foundations for buildings, decks of boats, Venetian blinds, picture-frames, etc. It bears exposure to water better than do most kinds of timber. This tree has been successfully grown in the south of Florida and in California. In Australia there are two species that yield important timber—*Gmelina macrophylla* and *Gmelina leichhardtii*. The latter attains a height of 120 feet, with a diameter of 4 feet, and is one of the most valuable timbers of the country, where it is known as beech or white beech, although it is in no way related to the white beeches of Europe and America. The sap-wood of the former species is mottled, heavy, close-grained, and valuable.

GMÜND, gmynt. A town of the German Kingdom of Württemberg, situated in the beautiful valley of the Rems, about 32 miles southeast of Stuttgart (Map: Germany, C 4). The most noteworthy churches are the Romanesque Church of Saint John and the fourteenth-century Church of the Holy Cross, with a sculptured portal and a carved altar. The thirteenth-century Dominican monastery of Gotteszell is now used as a prison, and the Church of Saint Salvador, situated outside of the town, is visited by many pilgrims. Gmünd is well provided with educational as well as benevolent institutions. The chief manufactures are wooden and iron articles, flour, and especially jewelry and other gold and silver goods. There is a considerable trade in local manufactures. Gmünd, first mentioned in the twelfth century, became an Imperial free city in the thirteenth century, and retained its independence until 1803. Population, in 1890, 16,818; in 1900, 18,699.

GMÜND, von. A German family of stonecutters. For the more important members, see **PARLER**.

GMUNDEN, gmōōn'den. A favorite summer resort and watering-place of Upper Austria, charmingly situated at the northern end of Lake Traun, 1395 feet above the sea, about 50 miles northeast of Salzburg (Map: Austria, C 3). It is well built and lighted by electricity, and has many handsome villas in the environs. Being in the most picturesque part of the Salzkammergut, Gmunden offers many delightful excursions. Population, in 1890, 6476; in 1900, 7126.

GNAT (AS. *gnæt*). A name applied to several kinds of small flies, and in England to mosquitoes. Having been replaced by 'mosquito,' the word is becoming obsolete in North America. The commonest form to which it is still applied are the fungus-gnats (Mycetophilidæ) and the gall-gnats of the family Cecidomyiidae. The fungus-gnats are mosquito-like, but are easily recognized by the great length of the coxal (or uppermost) joint of the leg. They are found in great numbers on fungi and around decaying vegetable matter found in damp places. They can leap actively, as well as fly. The gregarious larvæ live in such vegetable matter. In some species the larvæ before pupating will form a marching army in which the individuals are four to six deep. The gnats of the dipterous genus *Sciara* frequently swarm in houses during summer evenings. The gall-gnats have the body and wings covered with long hairs, that are easily lost. The larvæ are small maggots, often bright-colored, and live in plants, in which they form galls. The Hessian fly that infests wheat belongs here, and also the resin-gnat that infests pine. See **FUNGUS-GNAT**; **GALL-GNAT**; **MOSQUITO**; **BLACK FLY**.

GNAT-CATCHER. A small insectivorous bird, related to the Old World warblers, and peculiar to America, especially to Central and South America. About fifteen species are known, of which three reach the United States. The coloration is bluish-ash, paler below; tail black and white. They are said to be good singers. The commonest species is the blue-gray gnat-catcher (*Poliophtila carulea*), which is found in summer as far north as Massachusetts, from the Atlantic to the Pacific. It breeds throughout its range, making a singularly beautiful nest in the form of a tiny cup, set upon the upper side of a lofty tree-limb, and coated with lichens until it simulates a mossy excrescence. Two other species are found in the Southwestern United States, near the Mexican border.

GNATHO, nā'thō. A sycophant in Terence's *Eunuchus*, and in later comedy the typical name for a parasite.

GNATHOBDELLIDA, nāth'ōb-dēl'i-dā (Neo-Lat. nom. pl., from Gk. γνάθος, *gnathos*, jaw + βδέλλα, *bdella*, leech). The order of worms of the class Hirudinea which includes those leeches that have no proboscis, as the common parasite leech, the horse-leech, the land-leech, and related forms. See **LEECH**.

GNAT-SNAPPER. A name given to certain Old World birds that seize insects on the wing, often with an audible snap of the beak, such as the bee-eater (q.v.).

GNAUTH, gnout, ADOLF (1840-84). A German architect, born in Stuttgart, where he was educated at the Polytechnic Institute. In 1861-63 he pursued his studies in Italy, whither, after a stay in Vienna, he went again in 1864, to collaborate with Emil von Förster in making the designs for Raschdorff's *Palustarchitektur von Oberitalien und Toscana* (Berlin, 1883), and where he was once more during the summer months of 1867-69, painting large-sized water-colors of the monuments of the Renaissance for the Arundel Society in London. Appointed professor at the Polytechnicum in Stuttgart, in 1870, he resigned in 1872, in order to execute orders for the erection of a number of private buildings. He visited Greece and Egypt in 1875, Spain and Southern France in 1882, and became director of the Industrial Art School at Nuremberg in 1877. An adherent of the late Renaissance style, he adapted in an original manner the palatial architecture of Italian cities to his structure.

GNEDITCH, gnä'dich, NICOLAI IVANOVITCH (1784-1833). A Russian poet. He was born at Poltava, and was educated at the University of Moscow. He went to Saint Petersburg at the age of nineteen, and was employed there in the Ministry of Education and in the Imperial Public Library. He devoted especial attention to translation of the classical poets of Europe, his best work in that field being the Russian version of the *Iliad* (latest ed. 1880). The work was begun in 1809 and completed in 1829, and is a masterpiece of versification. He wrote several original poems of high merit, and translated into Russian some works of Shakespeare, Voltaire, Schiller, and other European poets.

GNEISENAU, gní'ze-nou, AUGUST, Count NEITHARDT VON (1760-1831). A Prussian field-marshal and one of the most prominent figures in the War of Liberation. He was born in Schildau, in Prussian Saxony, October 27, 1760. In 1777 he entered the University of Erfurt, and two years later joined an Austrian regiment. In the following year he entered the service of the Margrave of Ansbach-Bayreuth, and in 1782 went to America as an officer in the mercenary force raised by Great Britain in Germany. He returned, however, in the following year without having seen any actual fighting. In 1786 he entered the Prussian service as lieutenant of infantry. The next twenty years, with the exception of a year's active service in Poland in 1793-94, were spent in the quiet of garrison life. During this time, however, Gneisenau became a profound student of military and political history. In 1806 he took the field against Napoleon and fought at Saalfeld and Jena. He was raised to the rank of major, and was intrusted, in April, 1807, with the defense of Kolberg, which was invested by a large French army. With the aid of Schill and Nettelbeck he carried on a heroic resistance against the greatly superior forces of the French until hostilities were concluded by the Peace of Tilsit. For his services he was raised to the post of chief of engineers, and was made a member of the council to which was intrusted the task of reorganizing the Prussian State, which had exhausted its forces in the disastrous war against Napoleon and had been dismembered by the Peace of Tilsit. In this work of national revival he coöperated heartily with Stein and Scharnhorst,

and though primarily devoted to the problem of military reorganization, exercised considerable influence on the general policy of the Ministry. After Stein's dismissal he resigned (1809), owing to the hostility of Napoleon, and from 1811 to 1813 was intrusted with secret missions to Austria, Sweden, Russia, and England. Upon the outbreak of the War of Liberation in 1813, he became major-general in the corps of Blücher, and subsequently chief of staff to the Army of Silesia. In this position Gneisenau displayed remarkable strategic talents, a relentless energy, and a daring which contributed, in no small degree, to the success of the Prussian arms. He became lieutenant-general after the battle of Leipzig, and upon the return of Napoleon from Elba was made once more chief of staff under his old commander, Blücher. After the repulse of the Prussians at Ligny, June 16, 1815, he executed a skillful retreat, and to him was due, in large measure, the opportune arrival of the Prussians on the battlefield of Waterloo, June 18th. After the decision of the battle he led the pursuit, turning the French retreat into a complete rout. He was made Governor of Berlin in 1818 and field marshal in 1825. Soon after the outbreak of the Polish insurrection of 1830 he was assigned to the command of the Prussian corps on the Polish frontier, but he died at Posen, August 24, 1831. Gneisenau has assumed in Prussian history the dimensions almost of a national hero. He was with Stein, Scharnhorst, and York, one of the small band of patriots who, in the hour of Prussia's deepest degradation, never despaired of their country, and later, when an opportunity offered for overthrowing Napoleon, devoted themselves to the destruction of the hateful French domination. In Gneisenau, moreover, ardent patriotism was combined with a most lovable nature, marked by natural gentleness and refined by years of study and by travel. There is a monumental life of Gneisenau in five volumes by Pertz and Delbrück (Berlin, 1864-80); an abridgment of this was published by Delbrück in two volumes (Berlin, 1894).

GNEISS (Ger., probably connected with OHG. *gneista*, Icel. *gneisti*, AS. *gnást*, Eng. *gnast*, spark). A family of rocks belonging to the metamorphic series, and resembling granite in composition. Gneisses are granular aggregates of feldspar and quartz, with mica, hornblende, or pyroxene, and some of the rarer metals. Their structure is characterized by a parallel arrangement of the constituents: the light and dark minerals alternate in bands or layers, which are sometimes so regular and distinct as to give the appearance of stratification. Owing to this peculiarity, many geologists hold that they are metamorphosed sediments. There is conclusive evidence, however, that the parallel arrangement may be brought about in rocks of truly igneous origin, either as a result of movements of the constituents while the magma is in process of solidification, or by compression and shearing strains after the rock mass has solidified. Some gneisses, doubtless, have resulted from the metamorphism of sediments; but in such cases the proof is not based primarily upon the gneissoid character. Neither the igneous nor the sedimentary theory of origin is to be accepted for gneisses as a class, and each occurrence must be studied by itself. For this reason, geologists have come

to use the term gneiss in its structural sense, without implying anything further as to origin or constituent minerals. When it is desired to define the composition of a particular type, other rock names are united with the term; for example, granite-gneiss, syenite-gneiss, gabbro-gneiss, or granitic gneiss, syenitic gneiss, gabbroic gneiss. Gneisses are the most widely distributed of metamorphic rocks (q.v.), and are found underlying the earliest sediments in almost all parts of the world. Consult: Kemp, *Handbook of Rocks* (New York, 1900); Rosenbusch, *Mikroskopische Physiographie der Mineralien und Gesteine* (Stuttgart, 1896). See GEOLOGY.

GNEIST, gníst, RUDOLF VON (1816-95). A German jurist and statesman, born in Berlin, August 13, 1816. He was graduated from the University of Berlin, and while occupying the post of lecturer in the university practiced the profession of law. In 1844 he became professor extraordinary of jurisprudence, and in 1850 he resigned his position as assistant judge of the Superior Court to devote himself more exclusively to teaching. In 1858 he became a member of the Lower Prussian House, where he served till 1893. He was prominent as a Liberal in that body and in the Reichstag, of which he was a member from 1867 to 1884. Gneist was an active member of the Liberal opposition, and subsequently of the National Liberal Party, among whom his profound scholarship made him an intellectual leader. Several of his ablest works relate to the English Constitution, which he greatly admired, and which he studied and cited as a model in the discussion of German affairs. His first notable work was *Geschichte und heutige Gestalt der Aemter in England* (1857). Other important works of special interest to English students, and appearing in English translations, are: *Englische Verfassungsgeschichte* (1882) and *Das Englische Parlament* (1886). He also wrote *Der Rechtsstaat* (1872), and numerous other works on the history of jurisprudence and legislation. Consult Gierke, *Rudolf von Gneist* (Berlin, 1895).

GNESEN, gná'zen (Pol. *Gniezno*). A town in the Province of Posen, Prussia, capital of a circle of the same name, situated in a district abounding in hills and lakes, 31 miles east-northeast of Posen (Map: Prussia, G 2). Its old and noteworthy cathedral, begun in the tenth century, is adorned with fine paintings, bronze doors, and chapels, and contains the tomb of Saint Adalbert, who was bishop here. There are also an archiepiscopal palace, a theological seminary, and a gymnasium. The manufactures include machinery, lumber, sugar, and flour. Tradition fixes the year 550 as the date of the foundation of Gnesen, the oldest town in Poland. It became an archiepiscopal seat in 1000, and during the Middle Ages was for a time the residence of the Polish kings, who were crowned here until 1320. The archbishops of Gnesen were primates of the realm and acted as vicars during the frequent interregnums. Population, in 1890, 18,088; in 1900, 21,693, one-half being Poles.

GNETACEÆ, nê-tá'shâ-ê (Neo-Lat. nom. pl. from *Gnetum*, from Malay *gnemon*, *gnemo*, the native name). One of the great groups of gymnosperms, which comprises at present three genera, that differ remarkably in habit and habitat.

The genera are *Ephedra*, with about 30 species, from the arid regions of both hemispheres; the very peculiar *Tumboa* (*Welwitschia*), from the extremely arid regions of Western South Africa; and *Gnetum*, with about 15 species, from the tropics of both hemispheres. The species of *Ephedra* are low, straggling shrubs, with long-jointed and fluted green stems, and opposite, scale-like leaves connate into a two-toothed sheath. The body of *Tumboa* has the shape of a gigantic radish, which rises little above the surface of the ground, and whose crown is sometimes 12 to 15 feet in circumference. From the edge of the crown two enormously long, parallel-veined leaves arise, which extend upon the ground sometimes for 10 to 15 feet, and become split into numerous ribbons. This single pair of opposite leaves, the only pair produced, grows continually at the base, and lasts through the lifetime of the plant, which is said to reach more than a hundred years. The species of *Gnetum* are either small trees or woody climbers, and are among the prominent lianas of tropical forests. The foliage is leathery in texture and suggests dicotyledons, as the well-developed opposite leaves are lanceolate to ovate in outline and pinnately net veined. See Plate of GYMNOSEPERMS.

The group is of special interest to the botanist on account of the display of certain angiospermous characters that have suggested that *Gnetaceæ* may have given rise to the angiosperms; but such a theory has been abandoned by most morphologists. The characters that distinguish the group from other gymnosperms are the occurrence of true vessels in the secondary wood, and the presence of a so-called perianth. In addition to these two distinguishing characters, the group has the following four characters in common, but not peculiar to it: (1) Opposite leaves; (2) dicotyledonous embryos; (3) cauline ovules; and (4) no resin-ducts. Some fossil forms of plants referable to the *Gnetaceæ* have been found; the majority from Tertiary deposits seem to belong to the modern genus *Ephedra*. The stems and female flowers of a species of *Ephedra* are found commonly in finely preserved condition in the Tertiary amber of the Baltic provinces. Stems and leaves of still earlier age, resembling those of *Ephedra*, and hence called *Ephedrites*, have been obtained in the Jurassic rocks of Eastern Siberia.

GNOLI, nyô'lâ, DOMENICO (1839—). An Italian author, born in Rome. He attracted public attention by his volume of poems published under the pseudonym of 'Dario Gaddi,' and a collection of critical essays, *Odi Tiberine*. He was professor of Italian literature at Turin, and in 1893 was made prefect of the Library Vittorio Emanuele at Rome. He collaborated on the *Nuova Antologia*, and founded and was an editor of the *Archivio Storico dell' Arte*. His translations include the *Römische Elegien* of Goethe, and various other German classics. Many of his original essays were published in the *Nuova Antologia*. His other writings are: *E morto il re* (1882); *Canto dei pellegrini alla tomba del gran re* (1883); *Le opere di Donatello in Roma*; *Il banco d'Agostino Chigi*.

GNOME, nôm (Fr. *gnome*, apparently from Gk. γνώμη, *gnômê*, knowledge, or from γνώω, *gnôō*, one who knows, from γινώσκω, *ginôskō*, to know). A name given in the cabalistic

and mediæval mythology to one of the classes of beings which are supposed to be the presiding spirits in the operations of nature in the mineral and vegetable world. They have their dwelling within the earth, where they preside specially over its treasures, and are of both sexes—male and female. (See INCUBUS; KOBOLD.) The males are often represented in the form of misshapen dwarfs.

GNOME (Gk. γνώμη, knowledge, judgment, maxim). A short and pithy proverbial saying, often embodying a moral precept. Such have been common among nearly all nations at some period of their development; examples are plentiful in the Bible. In Greece the period when men began to express in a proverbial form general maxims of conduct was the age of the Seven Wise Men. The gnomic form of expression became also a characteristic of much of the lyric poetry of the period, and such poetry as had this characteristic was called at a later time *gnomic* (γνῶμικός). Lyric poets in whose verse this gnomic character prevailed or was prominent are Solon, Theognis, Phocylides, Simonides of Amorgus, and Xenophanes. There are editions of the gnomic poets by Brunck (Strassburg, 1817), Schäfer (1817), and Bergk, *Poetæ Lyrici Græci*, vol. ii. (4th ed., Leipzig, 1882). Consult also Opsimathes, Γνῶμαι; sive *Thesaurus Sententiarum et Apophthegmatum* (Leipzig, 1884).

GNOME OWL. One of the diminutive or 'pygmy' burrowing owls of the Western United States; especially *Glaucidium gnoma*. See BURROWING OWL.

GNOMON, νόμων (Gk. γνώμων, one who knows). The name given to odd numbers by Pythagoras. An odd number of the form $2n + 1$ was known to be the difference of two square numbers $(n + 1)^2$ and n^2 . This doubtless arose from the geometric conception of a gnomon as the difference between two squares or rectangles; e.g. take a square of side 3 (see figure) and extend its length and breadth one unit. The resulting figure is a square of area 16. The difference of these squares, $16 - 9$, or 7, represents an odd number or gnomon.

The term gnomon was also applied to a kind of sun-dial (consisting of a staff through the centre of three concentric circles), probably introduced into Greece by Anaximander (B.C. 610-546).

GNOSTICISM, νόσ'τι-σιζ'μ (from *gnostic*, from Lat. *gnosticus*, Gk. γνωστικός, *gnōstikos*, relating to knowledge, from γνώσις, *gnōstis*, knowable, from γινώσκω, *gignōskō*, to know). The name given to several more or less closely related speculative systems, which flourished in the Church of the second century. Like much of the philosophy of that time, the Gnostic systems were syncretistic, drawing their materials from Jewish, Christian, and pagan (Oriental) sources. They were cosmological rather than theological in character, their aim being to describe how the cosmic order was originally projected, then lost, and finally restored.

Knowledge appears among the 'spiritual gifts'

of the New Testament (I. Cor. xii. 8; xiii. 2), and Paul refers also to a 'hidden wisdom' (*σοφία*), which he ventured to use among the 'perfect' (I. Cor. ii. 6, 7). Such expressions as these make it easy to understand how the apostolic teaching might easily come to be regarded as esoteric, as was the case among some Gnostic sects in the second century. Even before the close of the New Testament we find warnings against a 'false' knowledge (I. Tim. vi. 20), which doubtless refers to some kind of Gnostic speculation already judged to be dangerous to the faith. Nevertheless, Gnostic ideas were long current within the Church, and often during the early period they were maintained without offense. Ignatius of Antioch, at the beginning of the second century, uses Gnostic language in speaking of Christ as the Logos of God, 'who proceeded from silence' (*Ep. to Magnesians*, 8). And in *II. Clement*, 14, we meet again with Gnostic terms, where the preacher says: "I do not suppose ye are ignorant that the living Church is the body of Christ, for the Scripture saith God made man male and female. The male is Christ, and the female is the Church." In other words, the Gnostics were Christian theologians, a fact which is forgotten by some who have attempted to describe them. Their form of religious thought was but one out of many tendencies in their time—a tendency, to be sure, diverging from the main line of development until at last it was pronounced heretical, yet whose history, until that time came, falls within, not without, the Church. Their leaders were persistent in maintaining that they drew their inspiration and authority from apostolic sources. So Valentinus traced his connection with Paul through one Theudas; Basilides with Saint Peter through Glaukias (*Clement of Alexandria, Stromata*, vii. 17). We learn from Epiphanius that Ptolemy declared he had the authority of 'apostolic tradition' for what he taught. In this respect the Gnostics pursued the same course as the ancient Catholic Church. But when Irenæus wrote his great work, *Against Heresies* (A.D. 180-90), the Church had already begun to distinguish between 'ordinary' (i.e. orthodox) Christians and Gnostics, whom Irenæus calls 'heretics.' We may therefore infer that about this time the exclusion of Gnostics from Church fellowship was beginning. After the close of the second century, whenever the claims of 'knowledge' are freely advanced and maintained by prominent writers (as, e.g. by Clement of Alexandria and Origen), it is a permissible Christian Gnosticism which they are describing and defending, not the Gnostic heresy which the Church had by that time rejected. To Clement the Christian is the only true Gnostic (*Stromata*, vii. *passim*).

In the almost complete absence of Gnostic literature, we are forced to rely upon its orthodox opponents for information concerning the heresy. Our most important witnesses are Irenæus, Tertullian, Hippolytus, and Epiphanius; but light is also cast upon its early forms by Ignatius and Justin Martyr. Gnostics were numerous after the end of the first century, and found in widely separated localities. (For the names of the leaders and sects, see GNOSTICS.) Their teachers differed from one another in details and in some important doctrines; nevertheless a remark made by Hippolytus in his account of the serpent-worshippers (*Refutatio*,

v. i.) might be applied to all Gnostics alike: "Their detached heresies are essentially one." All were practically agreed in holding some sort of dualistic theory of the world, that spirit and matter, good and evil, are essentially opposed to each other. Whatever comes in contact with matter shares in its contamination; therefore the supreme God cannot be the Creator of the world. Of the supreme God indeed hardly anything can be predicated. He (It) is wholly transcendent, utterly remote from all that we know as existing. We might even call Him (It) the 'Non-existent,' as does Hippolytus. From information given mainly by Irenæus in his work *Against Heresies* we are able to construct an outline of the teaching of Valentinus, from which the place occupied by the Creating God will appear in due course. At the two extremities of thought are transcendent Deity and the Void, or Emptiness (*κένωμα*). Between them there is no connection or communication. No world exists, nor is there any creative agency to produce a world. There is a series of divine beings, ideas, or powers, called *Æons* (*αἰῶνες*), which emanate in pairs from the First Cause, with diminishing dignity as they proceed. These *Æons* together constitute the *Pleroma* (*πλήρωμα*) or Fullness of divine existence, as over against the *Kenoma*, or great Void. They are endowed with sexual polarity, a masculine and a feminine appearing together; for example, *Nous* (*νοῦς*, mind) and *Aletheia* (*ἀλήθεια*, truth); *Logos* (*λόγος*, word or reason) and *Zoe* (*ζωή*, life). These names remind one of the Gospel of John, from which very likely they were derived. The total number is thirty, corresponding to the unknown and mysterious years of Christ's life, before he began his public ministry. They are arranged in groups of an Ogdoad, a Decad, and a Duodecad. One of the lowest and feeblest *Æons*, *Sophia* (*σοφία*, wisdom), rashly attempts to mount up to a union with the great First Cause, or Father of All, and thereby interrupts the order or equilibrium of the whole system, which is the Gnostic 'fall.' By a complicated process some sparks of divinity become entangled with their opposite, namely the great Void, and from the resulting confusion emerges the Creator, or Demiurge (*δημιουργός*, which suggests Plato's creating god), who proceeds to form the visible world, including man. He is the Jehovah of the Old Testament, the only God known to the Jews, but of course not the Supreme Being himself. The material creation, being more or less directly the consequence of an interrupted order, is itself by nature evil. And this evil quality, from which nothing material escapes, includes the human race.

The problem of redemption for the Gnostics was to restore the lost cosmic order, to remedy the evil caused by the weak and erring *Æon*, to liberate those sparks of Deity which had become entangled in the meshes of evil matter and in man. Christ is an instrument in the accomplishment of this task—Himself an *Æon* indeed, who was apparently joined with Jesus of Nazareth from the time of His baptism to His crucifixion. This union was *doctetic*, that is, only a seeming. The heavenly Christ did not in fact suffer or die, but left the man Jesus before His death on the cross. (See *DOCTÆ.*) Christ's office, so far as men are concerned, was to teach

the true 'knowledge,' to make Gnostics, to impart the secrets of that system to which He Himself belonged. The redeemed are those who can receive this esoteric teaching, and become free from the flesh. Their salvation is only an incident in the vast process of restoring the lost harmony of the *Pleroma*—a very different matter from the Christian idea of being saved from sin.

According to the ethical system of the Gnostics, all men are divided into three classes, according as they have, or have not, elements of deity within them: spiritual or pneumatic men (*πνευματικοί*); animal or psychic men (*ψυχικοί*); and carnal or physical men (*σαρκικοί*, *σωματικοί*). The Gnostics themselves constitute the members of the first group; they will be saved through their knowledge of the esoteric system and through their ascetic life. The third group are wholly material and cannot be saved, for their nature is evil; they have no single spark of the divine within them. In the intermediate class ordinary Christians are found, persons who have not the higher knowledge, yet who may possibly—at least some of them—be saved through faith (*πίστις*), which is vastly inferior to 'knowledge.' In the practical relations of life the Gnostics applied their principles in one of two ways. Although these seem diametrically opposed to each other, yet each was supported by an appeal to the logic of their principle that matter is essentially evil. Some said: The body, being composed of evil matter, should be denied in its every tendency and impulse—whence resulted asceticism. Others said: It may be indulged in every physical gratification and even abused through over-use—whence resulted libertinism and sensuality. All the nobler Gnostics adopted the ascetic life, and some of them pushed it to an extreme (as e.g. the Encratites). The opposite theory of self-indulgence was advocated and practiced by such sects as the Carpocratians and Marcosians.

The traces of Christian teaching in this system are manifest. But not less evident is the influence of Hellenic and Oriental speculation. Harnack has coined a phrase which is already proverbial (the 'acute Hellenizing of Christianity'), to describe the progress of Gnosticism. The attempt to Hellenize Christianity and explain away its doctrines in the light of the 'higher knowledge' was parallel to the line which heathen philosophers had taken with popular theology, which they admitted contained some manner of truth accommodated to the ignorance of the multitude. So Gnosticism would admit the necessity of faith for the vulgar multitude, but reserved the 'higher knowledge' for the few who were fitted to receive it. This knowledge was superior to and independent of the faith. The central idea of Gnosticism made it welcome to many who were half converted from Heathenism. The æsthetic instinct, which was the soul of Greek and Roman culture, revolted at the authority of the Church, which imposed the same belief on all, and exacted the same submission from philosopher and slave alike. In a system of compromise like Gnosticism, it escaped this ignominy.

In the course of the Gnostic controversy the Church defined her theory of the ancient Catholic standards, as the tests of orthodoxy, viz. the rule of faith, the canon of Scripture, and the episcopate, each of these being regarded as of

apostolic origin and authority. Upon them she relied not only for vindicating the truth of her doctrine and the sole validity of her practice, but also for proving the falsity of her opponents' position. With these standards once generally recognized, the Gnostics, who were in the minority, could be, and were, shut out from Christian fellowship. This development was under way long before the close of the second century, and was practically complete in the age of Cyprian (c.250 A.D.), when Gnosticism had already become a negligible factor. In fact, after Marcion in the middle of the second century, Gnosticism is of little practical importance, though its tendencies reappear in the Manichees and Manichæan sects of the Middle Ages.

GNOSTIC WRITINGS. Basilides's twenty-four books on the Gospel, entitled *Exegetica*, have for the most part perished, along with other early heretical works, but we have some quotations from them in the early Christian literature. There is at present no way of verifying Origen's statement that Basilides wrote a gospel of his own, nor have we the *Gospel of Truth*, which Irenæus attributes to the Valentinians. The *Letters*, *Homilies*, and *Psalms* of Valentinus have likewise perished. Fragments have come down to us from the works of Bardesanes, a Christian poet of Syria (died after A.D. 220), who is sometimes classed among the Gnostics. In the *Pistis Sophia* we possess an Egyptian Gnostic writing of the third century, preserved in Coptic, relating the history of Wisdom in the form of a dialogue between the risen Christ and His disciples. Here asceticism is put forward as a Christian duty, and we find something closely akin to the sacramental theory of penance. Other valuable Coptic versions of Gnostic works have recently been discovered by Carl Schmidt. Epiphanius preserves for us a letter from the Valentinian Ptolemy to Flora. There are several books of Gnostic *Acts*, bearing the names of Peter, John, Thomas, and Andrew, which appear to have been circulated in a collection which passed under the name of one Leucius.

BIBLIOGRAPHY. On the literature of Gnosticism, consult: Harnack-Preuschen, *Geschichte der altchristlichen Litteratur* (Leipzig, 1893); Krüger, *History of Early Christian Literature* (New York, 1897); Mead, *Pistis Sophia*, translation (London, 1896); Lipsius, *Der Gnosticismus* (Leipzig, 1860); King, *The Gnostics and Their Remains* (2d ed., London, 1887); Mansel, *The Gnostic Heresies of the First and Second Centuries* (London, 1875); Hilgenfeldt, *Ketzergeschichte des Urchristenthums* (Leipzig, 1884). The most important attacks upon the Gnostics may be read, in English, in the *Ante-Nicene Fathers*, ed. by Cox (10 vols., New York, 1885-96). In general, consult: Harnack, *History of Dogma*, vol. i. (London, 1894); Rainy, *The Ancient Catholic Church* (New York, 1902). See BASILIDES; CARPOCRATES; CERDONIANS; CERINTHUS; DOCETÆ; ENCRATITES; HERACLEON; MARCION; NICOLAÏTANS; OPHITES; SETHITES; VALENTINIANS.

GNOSTICS. Those who adhered to the early heresy known as Gnosticism. From the end of the first century onward for two generations Gnostic heretics were many and widely scattered. "A multitude of Gnostics have sprung up, and have shown themselves like mushrooms growing

out of the ground," says Irenæus. Among them all we may distinguish two main types, a Jewish and a Greek. Cerinthus and Menander are the most famous early representatives of the former, and among the many sects of Jewish origin or affiliation the Nicolaitans, Sethians, Cainites, and Ophites (serpent-worshippers) may be mentioned. Cerinthus and Menander were earlier in point of time than the great Gentile leaders, but their systems played a much less important part in history. Among the more influential Gentile Gnostics were Carpocrates, Saturnilus, Cerdo, Basilides, Valentinus, Isidore, Heracleon, Ptolemy, and Julius Cassianus. Saturnilus (or Saturninus, as he is sometimes called) represents the Syrian school, to which Tatian and the ascetic sect of the Encratites are in a measure related. Basilides and Valentinus are the masters of the Alexandrian Gnostics, the school which was by far the most important, and about which we have the fullest information. Basilides taught in the time of Hadrian. Valentinus went from Alexandria to Rome, where he labored (c.140-160 A.D.) and founded a church. Marcion, of Pontus (q.v.), while resembling the Gnostics in some of his teachings, is hardly to be regarded as one of their number. See GNOSTICISM, and the articles on the Gnostic teachers and sects.

GNOTHO, nō'thō. An aged bumpkin, in Massinger, Middleton, and Rowley's play *The Old Law*. He tries to take advantage of an antiquated legal quibble to get rid of an old wife and marry a new one.

GNU, nū (from Hottentot *gnu, nyu*), or WILDE-BEEST. A member of a remarkable genus (*Connochetes*) of African antelopes, of which the best-known species has been formerly described as made up of parts of an antelope, a buffalo, and a horse. The grotesque appearance of some species suggests this composite. (See Plate of ANTELOPES.) The gnus form a genus of large, ungainly animals, having horns in both sexes, and the withers higher than the haunches. The body and legs are antelope-like, but the head is so massive and broad as to resemble that of an ox. The

HORNS OF GNU.

Showing development from the yearling (1) through youth (2) to maturity (3) in the white-tailed guu.

muzzle is naked, the eyes are small, with a gland beneath each, whence sprout long, stiff hairs, and the horns, which in old age form a helmet over the forehead, are broad, black, and shaped like an African buffalo's, to which must be added the bovine-like circumstance, not present elsewhere among antelopes, that the horn-cores are honey-combed with cavities. Long hairs bristle about the chin and throat, and a stiff mane is borne upon the arched crest of the neck; while the tail

is profusely hairy, like that of a horse, and sweeps the ground.

There are two species. The once 'common' gnu, or white-tailed wildebeest (*Connochetes gnu*), formerly roamed all over South Africa, but by the end of the nineteenth century had become so scarce as to be extinct except in the remoter districts; its dependence upon water denied it the desert, which has been the means of preserving some of its former associates. In this species long hair fringes the chest, and the color is uniformly deep brown, with the tail white. In the other species, the brindled gnu or blue wildebeest (*Connochetes taurina*), whose habitat was north of the Zambezi, wherever plains extended, the chest has no long hair, the tail is black, and the general color duller, and marked with dark vertical stripes upon the shoulders and neck. The former stands about four and a half feet high; the latter is somewhat larger. The females of both are lighter in hue than the males.

Gnus went about in bands of thirty or forty, and were fond of associating with quaggas and zebras, whose actions their own resembled. The old bulls were extremely watchful, and usually the first to discover danger and give the alarm. See ANTELOPE; and Plate of ANTELOPES.

GOA, gô'â. A Portuguese colony on the Malabar coast, India, extending from latitude 14° 54' to 15° 45' N., and from longitude 73° 45' to 74° 26' E. (Map: India, B 5). It is 60 miles long by 30 miles broad, and contains an area of 1080 square miles. It has been a Portuguese possession since its conquest by Albuquerque in 1510. Population, in 1891, 561,400. Capital, Panjim.

GOA. A city on the Malabar coast, India, in latitude 15° 30' N. and longitude 74° E., the former capital of the Portuguese dominions in India (Map: India, B 5). It was once a city of great magnificence with 200,000 inhabitants, and important chiefly on account of its harbor, one of the best on the west coast, from which it was about three miles distant. Its decline was due to the ravages of cholera in the beginning of the eighteenth century, when most of the Portuguese left it, and settled nearer the harbor of Panjim, or New Goa, which is the present seat of the colony, with a population of about 8500. The old city is the see of an archbishop, the primate of the Portuguese Indies, and contains an imposing cathedral, besides many interesting ruins. Panjim, on the Mandavi River and connected by the Portuguese West India Railway (51 miles) with British India, is a clean and picturesque town, with a good modern harbor, viceregal palace, college, and public library. Rice, cocoanuts, and spices constitute the chief products and exports. For a description of ancient Goa, consult Marryat, *Phantom Ship* (London, 1839).

GOA. A gazelle (*Gazella picticaudata*), inhabiting the highest pastures of the Thibetan plateau, and having a very heavy coat of hair in adaptation to its cold habitat.

GOA CEDAR. See CYPRESS.

GOAJIRA, gô'â-hê'râ. A peninsula of South America, forming the most northern part of the continent. Its area is estimated at over 5000 square miles (Map: Colombia, C 1). The coasts are mostly sandy and low, while the interior contains a number of mountains. It is sparsely watered, and the chief occupation of the inhab-

itants is cattle-breeding. Its people are semi-independent Indians, known under the name of Goajiros, and variously estimated at from 30,000 to twice that number. The peninsula was formerly divided between Venezuela and Colombia, but by the decision of 1891 it was awarded to the latter.

GOAJIROS. An Arawakan tribe of the Goajira Peninsula, on the northwest of Lake Maracaibo, South America. This most interesting tribe build their houses in the Maracaibo and other lagoons of Venezuela, driving piles into the mud, and erecting on them oblong rectangular dwellings with high-pitched roofs. The structures are thatched, and have on one or more sides platforms on which cooking and the family occupations are carried on in open air, and which also serve as landing-places for canoes. The name Venezuela, or little Venice, originated from the prevalence of these structures over the water. The people subsist by fishing, agriculture, and on the natural fruits, nuts, and roots of this bountiful region. They are expert in weaving cotton and palm textiles, and make beautiful featherwork.

GOA POWDER, ARAROA, or CRYsaroba. A drug imported in the form of a yellowish or chocolate-colored powder. The name Goa powder is derived from the Portuguese colony of Goa, where the drug appears to have been introduced about the year 1852. It was exported from Bahia to Portugal, whence it found its way to the Portuguese colonies in Africa and Asia. The tree which yields it (*Andria araroba*) is met with in great abundance in certain forests in the Province of Bahia, Brazil, preferring low and humid spots. It is from 80 to 100 feet high, and is furnished with imparipinnate leaves, the leaflets of which are oblong, about one and a half inches long and three-quarters of an inch broad, and somewhat truncate at the apex. The flowers are papilionaceous, of purple color, and arranged in panicles. The Goa powder, or araroba, is contained in the trunk, filling crevices in the heart-wood. To obtain it the oldest trees are selected as containing the larger quantity, and after being cut down are sawed transversely into logs, which are split longitudinally, and the araroba chipped or scraped off with the axe. During this process the workmen feel a bitter taste in the mouth, and great care has to be taken to prevent injury from the irritating action of the powder on the eyes. In this state, i.e. mixed with fragments of wood, the Goa powder is exported. It is used in the form of an ointment made by rubbing together forty grains of the powder, ten drops of acetic acid, and an ounce of lard. It is used in several skin diseases, especially in ringworm and psoriasis; and it owes its efficiency to the chrysophanic acid it contains.

GOAR, gô'âr', SAINT (?-575). A mediæval missionary, born in Aquitaine. According to the legends concerning him, he went to Oberwesel, Germany, in the reign of Childebert (511-58), where he erected a chapel at a point since called Saint Goar. He devoted himself to the propagation of Christianity, and is said to have made numerous converts. He was buried in the chapel built by him, and the monastery subsequently erected there became a chapter-house in 1127. In 1768 the celebrated Church of Saint Goar on the Rhine was dedicated to him.

GOAT (AS. *gāt*, Icel. *geit*, OHG. *geiz*, Ger. *Geiss*; ultimately connected with Lat. *hædus*, kid). A genus (*Capra*) of ruminant quadrupeds of the family Bovidae, so closely allied to the sheep that it is not easy exactly to define the distinction, although the common domestic goat and sheep are of widely different appearance. One of the most marked of the distinguishing characters is that the horns of goats, present in both sexes, but smaller in the females, are long, and directed upward, backward, and outward, while those of the sheep are more or less spirally twisted. Other characteristics are the beard on the chin of the male goats, which is wanting in the sheep, and the straight line of the face in goats, as compared with the arched line in sheep. The tail of goats is also much shorter than that of sheep. A constant mark of distinction is the absence in goats of a small pit between the toes of the hind feet (in some cases of all four feet), producing a fatty secretion, which exists in sheep, and is peculiar to them. And another constant mark which is absent in sheep is the strong smell of male goats, particularly during the rutting season. Equally constant are the differences of temper and manners, goats being in a high degree curious and confident.

WILD GOATS.

True wild goats, of which some ten species are recognized, belong to the Old World alone, where they are confined to the mountainous region which extends from the Atlas ranges of Northwestern Africa to Central Asia. Some other animals called goats are zoologically otherwise related. All are essentially mountain animals, and exhibit a great aptitude for scrambling among rocks and bushes, are extremely sure-footed, and display great strength and agility in leaping. They also prefer as food the leaves and small branches of shrubs, and the strongly aromatic herbs which abound in mountainous localities, to the herbage of the richest pastures, browsing rather than grazing, as do sheep. They live in small herds, but the old bucks are likely to live separately, and thus serve the purpose of scouts, though all are extremely wary, and hence are among the most difficult of game for the sportsman. Two kids are usually produced at birth, in late spring, and very quickly become able to travel with the band.

The best-known as well as most characteristic species of wild goat is the bezoar goat, or pasang (*Capra ægagrus*), which was once common throughout the Grecian Archipelago, but now is known only in Crete and one or two other islands, and thence eastward through the highlands of Asia Minor to Persia, and thence to Northeastern India. It inhabits all barren hills in the East, but in Persia rarely descends much below the timber-line. This goat (see Plate of WILD GOATS, ETC.) stands about 36 inches high, and in winter is brownish gray, changing in summer to a more reddish-yellow tint, with the buttocks and under parts nearly white; and the older bucks have the forehead, chin, beard, throat, front of the legs, a stripe along the spine, the tail, and a band on the flanks dark brown. The horns of the old bucks measure 40 to 50 inches along the curve, rise close together from the top of the skull, and sweep backward in an even curve, with the front edge forming a strong keel marked by irregular prominences; the horns of the female are much smaller and

smoother. The old bucks maintain a most vigilant watch, one or more being constantly on the lookout and warning the herd of danger. This is the species from which domestic goats have been derived. An illustrated account of this species will be found in the *Proceedings of the Zoological Society of London for 1875*, by C. G. Danford.

GOATS OF THE CAUCASUS, OR TURS. Three kinds of wild goats, distinguished as species, but perhaps only varieties of a single race, inhabit the Caucasus range, which in form and color much resemble the pasang, though somewhat paler as a rule, and with long reddish-brown beard and short scut. Their horns, however, are very different, being very massive, smooth, and black, with a squarish cross-section at the base, and sweeping outward and then inward, with a tendency toward a spiral, best shown in the Western or Severtzow's tur (see Plate of WILD GOATS, ETC.), which more nearly approach the form of the ibex's. The eastern Caucasus is inhabited by Pallas's tur (*Capra cylindricornis*); the central parts of the range, between Mount Elburz and Daghestan, by the Caucasian tur (*Capra Caucasica*); and the western part by the larger, more ibex-like Severtzow's tur (*Capra Severtzovi*).

THE SPANISH GOAT. Closely allied to the turs is the wild goat or 'cabramontes' (*Capra pyrenaica*) of the mountains of Spain and Portugal. It is a smaller animal than the others, bucks standing about 26 inches in height, with horns measuring 25 to 28 inches in length. Its horns are divergent, tend to be spiral, are somewhat triangular in section, with a strong keel on their posterior border, and knobs along the outside. These goats are so wary and resourceful that they remain numerous.

IBEX. All wild goats are frequently spoken of as ibexes, but the term should properly be restricted to four species of *Capra* dwelling upon the higher mountains of Southeastern Europe, Syria, Arabia, Abyssinia, and in the Himalayan region. They have long, knobbed, scimitar-like horns. See IBEX.

THE MARKHOR. This is a large wild goat (*Capra falconeri*) of the western Himalayas, distinguished by its high, upward-reaching flattened and spirally twisted horns. (See Plate of WILD GOATS, ETC.) It is found from Central Afghanistan to the sources of the Indus, and in this area exhibits several well-marked local races, in some of which the horns are much less twisted than in others, the longest measuring (along the curve) fifty inches. Its habitat ranges from barren foothills to the edge of the snow, and includes much rocky forest land; the country, therefore, is always an exceedingly difficult one to hunt in, besides which the animals are wonderfully keen and watchful. Nevertheless kids are captured from time to time, and are found to thrive well in captivity and to interbreed with domestic goats. The markhor is larger than other goats, and is distinguished by the great black beard of the old bucks, which covers the whole throat and breast with a mat of long hair, which also forms a heavy ruff around the shoulders. The remains of a goat closely resembling the markhor have been found in the Pliocene strata of India.

THARS AND GOAT ANTELOPES. There exist in Southern Asia three species of goat which have no beards and small horns, and are assigned to a separate genus, *Hemitragus*, the thars; one is

known to Anglo-Indian sportsmen as 'Nilgiri goat.' For an account of this genus, see THAR.

Intermediate between the goats and the antelopes stand several genera and species of mountain-loving animals, including the goral, cambingutan, serows, takin, chamois, and our American white goat. For these, see their names and GOAT ANTELOPE.

(London, 1896); Blanford, *Fauna of India: Mammals* (London, 1888-89); Blanford, *Eastern Persia: Zoology* (London, 1876); Danford, "Notes on the Wild Goat," in *Proceedings of the Zoological Society of London* (London, 1875). Consult also the writings of sportsmen in India and Central Asia.

DOMESTIC GOATS.

It is probable that the native Asiatic goats were among the first animals brought under the subjection of man, and there is no doubt that the main stock of those now in domestication was derived from the Persian pasang (see above). They must have been of peculiar value to the early nomadic men of Southeastern Asia, since they could pasture on the scanty herbage and bushes of the rocky mountains and plateaus, and move anywhere their masters went with even greater facility, conditions which domestic sheep could not well endure.

The varieties of the domestic goat are too many for treatment here, where only the most important can be mentioned. Those of Europe present many diversities of coat and form of horns, and distinguishable breeds are found in Ireland, Wales, and Norway, but no kind has the pendulous ears frequently seen in Asia, except a cream-colored breed peculiar to the island of Malta, whose ears hang below the jaw. This goat and some Spanish breeds are frequently hornless. More distinctive breeds exist south and east of the Mediterranean. Thus the 'guinea' goats, kept in enormous flocks by the natives of the Sudan and of the Niger Valley, are rather small, short-legged, short-haired, and usually dark in color, black and red prevailing. The horns are only three or four inches long, and curve forward at their tips; and the black beard is continued downward to spread over the shoulders and fore legs, suggesting some possible ancestral cross with the aoudad (q.v.). The Nile Valley and Egypt have a different goat, in which the legs and horns are longer; the profile is very convex, the horns crumpled, and often absent, and there is no beard. The short coat is usually reddish or bluish gray, more or less spotted, and the pendent ears are about as long as the head, flat, and round at the ends. The goats of Syria, Turkey, and Southwestern Asia, on the other hand, are large and tall, with the hair long, black, and silky, prominent curving horns, a small beard in both sexes, and the ears hanging for half their length below the jaw. These are sometimes called mamber or Kurd goats, and are the common stock of the country. In Asia Minor, however, there has existed, from immemorial times, a remarkable breed known as mohair or Angora goats, which merit particular description, since lately they have been sedulously cultivated in various other countries, including South Africa and the United States.

THE ANGORA GOAT. Various types of Angora goats have arisen in Asia Minor and Turkey dur-

ing the last half-century, owing to unwise crossing with the common Kurd stock. The pure-bred Angora was originally a small, exceedingly delicate animal, with small, thin horns, suggesting by their spiral form descent from the wild markhor. It was clothed with "dazzling white, fine, soft, silky, very lustrous mohair, curling in ringlets from 10 to 18 inches long." The continual crossing and re-crossing it has undergone has resulted in an animal much larger and more hardy. The type now approved in the United States (see Plate of WILD GOATS) is strongly built, with a straight horizontal back, short and strong legs, the head like that of a common goat, but less coarse, and the horns heavy, with an inward twist. "Except the face and legs, from the hocks and knees down, the entire animal should be covered with mohair. Both the belly and throat and even the lower part of the jaws should have a covering of fine, silky mohair in long, curly ringlets." These goats were introduced into the United States by a gift of nine from the Sultan of Turkey in 1849. Little increase followed, and all disappeared during the Civil War. Other importations were occasionally made until 1881, when the Sultan prohibited any exportation of the animals. Several were, nevertheless, obtained for California breeders in 1901. Angoras were scattered through the Southern States, but their raising and keeping did not become an industry until recently, when large flocks were produced on the Pacific Coast, especially in Oregon, and they have been successfully introduced in Iowa and Missouri. So promising have been these experiments that an extensive culture of this breed all over the United States, as well as in southern South America, is expected; and two clubs for the encouragement of the industry and the registry of blooded stock were organized in 1900. It is claimed for the Angora goats that they are among the most useful of domestic animals in a variety of ways. "The fleece, called mohair (q.v.), furnishes some of the finest of fabrics among ladies' goods, and is used in various other manufactures; their habit of browsing enables the farmer in a wooded locality to use them to help in subjugating the forest; their flesh is exceedingly delicate and nutritious; the milk, though not so abundant as with the milch breed of goats, is richer than cow's milk; their tanned skins, though inferior in quality to the skins of the common goat, are used for leather; their pelts make the neatest of rugs and robes; they are excellent pets for children; a few of them in a flock of sheep are a protection from wolves and dogs; their manure is noticeably helpful to the grass, which follows them after they have cleaned away the underbrush." A pamphlet was issued by the United States Department of Agriculture in 1901, containing an account, with illustrations, of the breed, and its qualities and products, and full directions as to feeding, care, shearing, etc. See *Bibliography*.

Goats otherwise have never taken a serious place in the farm property of the United States. The latest agricultural statistics enumerate only 45,500 in the whole country—a number exceeded by such small countries as Cape Verde Islands, and Senegal. The great bulk of the goats in the world, estimated at 36,000,000 in 1893, and 32,000,000 in 1896, are to be found in the south of Europe, in Syria, and in Northern Africa. **ALL**

GOAT-ANTELOPES

1. EUROPEAN CHAMOIS (*Rupicapra tragus*).
2. JAPANESE SEROW (*Nemorhaedus crispus*).
3. WHITE GOAT of Rocky Mountains (*Oreamnus montanus*).

4. THAR or HIMALAYAN GOAT (*Hemitragus jemlicus*).
5. HIMALAYAN SEROW (*Nemorhaedus bubalinus*).
6. HIMALAYAN GORAL (*Cemas gor.*).

the rest of the world together possesses scarcely a fifth of the total, and goats are almost absent from English-speaking countries the world over.

THE CASHMERE OR SHAWL GOAT. Nowhere have goats, other than Angoras, received more attention or been brought to a higher usefulness than in India, where a long list of varieties might be named and described, such as the streaked 'naga' of Assam; the 'bukee' of the Deccan, the 'maycay' of Mysore, etc. None of these equal in importance, however, those of the western Himalayan region, which are cultivated for the sake of their wool, of which the genuine Cashmere shawls are made. Two principal varieties of these are distinguished—the lesser, or chappoo, and the more common *changra* or 'shawl goat.' This variety is rather small, of various colors, but generally silvery white, with long, flattened, spiral horns, and pendent ears. These goats are valued not for the long outer hair, but for the underwool or *pashm*, which in summer is combed out and appears like grayish down. It is beautifully fine, soft, and silky, and from it are made the famous and often extremely costly shawls of Kashmir and its neighborhood. These goats were introduced into France and Germany during the last years of the nineteenth century, and have thriven well. Their natural home extends through Tibet through the mountains southwestward to the country of the Kirghiz, and enormous flocks are pastured by the natives in the high Himalayan valleys.

For the 'Rocky Mountain goat,' see **ROCKY MOUNTAIN WHITE GOAT**.

BIBLIOGRAPHY. Pegler, *The Book of the Goat* (London, 1886); Schreiner, *The Angora Goat* [in South Africa] (London, 1898); Thompson, "The Angora Goat," in *United States Department of Agriculture, Farmers' Bulletin No. 137* (Washington, 1901).

GOAT ANTELOPE. A term applied by zoölogists to a group of ruminants having characteristics that join them to the goats on one side and the antelopes on the other; most of them, individually described elsewhere, have a more or less goat-like build, goat-like teeth, short tails, relatively small cylindrical horns, and no beards. The group includes the genus *Cemas* of the Himalayan region (see **GOBAL**); the genus *Nemorhædus* of Southeastern Asia, including the cambing-utan of Sumatra, etc. (see **SEBOW**); the Tibetan genus *Budorcas* (see **TAKIN**); the genus *Rupicapra* of the European Alps (see **CHAMOIS**); and the genus *Oreamnus* or *Haploceros*, which contains the white, woolly goats of Northwestern America (see **ROCKY MOUNTAIN WHITE GOAT**). See **Plate of GOAT ANTELOPES**.

GOATFISH, or SALMONETE. A marine fish of the genus *Upeneus*, closely related to the surmullets, many species of which exist in tropical American waters, and are used as food, as well as admired for their gaudy beauty. The red goatfish is *Upeneus maculatus*; the yellow is *Upeneus martinicus*. Both are common at Key West, Fla., and in the West Indies.

GOAT ISLAND. An islet of 80 acres on the verge of Niagara Falls, dividing the current where it plunges over the precipice. It is joined to the American shore by a bridge.

GOAT-LOUSE. A biting louse of one or more species of the genus *Trichodectes*, parasitic in the hair of goats. Several species are known in

various parts of the world, most widely *Trichodectes climax*. The species commonly troublesome on the Angora or mohair goats is regarded by some entomologists as peculiar to that animal, and is named *Trichodectes limbatus*. Consult Osborn, "Insects Affecting Domestic Animals," in *United States Department of Agriculture, Division of Entomology, Bulletin 5* (Washington, 1897).

GOAT-MOTH. One of the largest of European moths (*Cossus ligniperda*), measuring 3 to 3½ inches across the expanded wings, and brown, with various streaks and mottlings. In Great Britain the long, flat, hairy, yellowish caterpillar is called the auger-worm, and wanders about in search of some suitable tree into which to bore a tunnel. It feeds upon the excavated wood more than three years, then spins at the extremity of the tunnel a very tough cocoon formed of wood chips glued together by a gummy secretion, in which a small aperture is left for the admission of air. The adults have no proboscis, take no food, are very short-lived, and take their name from the goat-like odor they exhale. Congeneric species dwell in the United States.

GOAT'S BEARD. See **SALSIFY**; also **SPIRÆA**.

GOAT'S-RUE. See **REST-HARROW**.

GOATSUCKER. The common European nightjar (*Caprimulgus Europæus*), known anciently as 'caprimulgus' in Italy and 'aigothelas' in Greece, and which stands as the representative of a large cosmopolitan family of wide-gaped, nocturnal, moth-catching birds, the *Caprimulgidae*. The name is due to an immemorial popular belief that this bird milks goats. The notion probably arose from the habit of these birds of seeking insects, usually at dusk and near the ground, in pastures with domestic animals. Their strange leaping motions and great mouth would easily lend themselves to the construction of such a tale among primitive folk, and it retained life by reason of its picturesqueness until it became established in the early books. As the great body of the family have never been accused of goat-milking, it seems better to forget the erroneous old name and call these birds 'nightjars,' in reference to the vibrating cries many of them utter after dark. See **NIGHTJAR**.

GOBAT, gô-bâ', SAMUEL (1799-1879). An English missionary, born at Crémone, in Switzerland. In 1826, after studying at the Mission House in Basel, and learning Arabic, Æthiopic, and Amharic, he started as a missionary of the English Church Missionary Society to Abyssinia. But he and his companion, Christian Kugler, got no farther than Cairo until 1829, when they went to Gondar, and met with much success. But in 1832, after Kugler's death and the beginning of hostilities, Gobat left the country. When he returned in 1834, he was too sick to work, and in 1835 went to Europe again. In 1839 he went to Malta, worked on the Arabic Bible, had charge of the presses there, and in 1845 was director of the Protestant College. A year afterwards he was appointed by Friedrich Wilhelm IV. of Prussia to the See of Jerusalem. There he did a great work, especially in his orphan schools, and in the hospitals at Jerusalem, Bethlehem, Joppa, and Nazareth. His experiences in Abyssinia are described in *A Journal of Three Years in Abyssinia* (1847; in French in Paris, 1834). Con-

sult Schölby, *Samuel Gobat, evangelischer Bischof in Jerusalem* (Basel, 1900).

GOBLE, JUSTICE. A typical bully of the 'bench,' in Smollett's satire *The History of Sir Launcelot Greaves*.

GOB'BO, IL. See SOLARI, CRISTOFORO.

GOBBO, LAUNCELOT. A quaint, shrewd clown, in Shakespeare's *Merchant of Venice*, at first a servant to Shylock, whom he afterwards deserts for Bassanio.

GOBELIN, gô'blân'. A family of French dyers, originally from Rheims. GILLES and JEAN GOBELIN (c. 1450) set up a dyeing establishment in the Faubourg Saint Marcel, Paris, on the edge of the Bièvre. Thè son of Jean and his descendants added to the family fortunes. After a while they gave up their business and bought titles, but kept the name of Gobelin. Henry IV. procured a portion of the family property for some tapestry-makers, and in 1662 Louis XIV. established the manufacture of the "Meubles de la couronne" in one of the old Gobelin houses, which gave the name to the wonderful tapestries afterwards produced there. See TAPESTRY.

GOBE-MOUCHE, gôb-môosh' (Fr., gaping-mouth). Originally the name of a certain species of birds termed fly-catchers. In its transferred use it refers to a person who has no opinion of his own, or to one who is generally idle.

Gobi, gô'bê, or SHAMO, shâ'mô. A vast desert region of Central Asia, constituting the eastern extension of the arid belt that stretches across the whole breadth of the Asiatic continent into Africa (Map: Asia, K 4). As generally defined, it includes only the desert area of Mongolia from the confines of Sin-kiang on the west to the Khingan Mountains on the east, although some geographers extend its western limits to Lob Nor, in about longitude 90° E. Beyond the Khingan range is a smaller arid region, commonly called the Eastern Gobi. The Gobi has the form of a great plateau, whose surface, lying 3000 feet or more above the sea, is divided into dreary wastes of sand, rocky tablelands, and mountains. The climate is severe, especially on the borders, and the rainfall scanty; the precipitation being generally sufficient, however, to furnish pasturage for flocks and herds during the summer months. Most of the nomadic tribes inhabiting the interior are Buddhists. The permanent settlements are confined to the northern part, which is traversed by spurs of the Tian Shan, Altai, and Yablonoi Mountains. A number of caravan routes lead across the desert from China proper to Siberia. Some allusions to the Gobi Desert are found in the writings of Marco Polo, but the first definite information we owe to the Jesuit Gerbillon, who made several journeys across the country in 1688-98. It was later visited by the Dutchman Ysbrand Ides, in 1692-94, and twice (1727-28 and 1736) by Lorenz Lange, who was sent by the Russian Government to Peking. The most accurate and valuable information about the desert was obtained by explorers in the last fifty years, especially by Przhevalski and Sven Hedin (qq.v.).

GOBINEAU, gô'bê'nô'. JOSEPH ARTHUR, Count de (1816-82). A French Orientalist, born at Bordeaux. He held various diplomatic positions in Europe, and represented France at Athens

(1868), at Rio de Janeiro, and Stockholm. His works include: *Trois ans en Asie* (1859); *Les religions et les philosophies dans l'Asie centrale* (1865); *Traité des inscriptions cunéiformes* (1864); and *Histoire des Perses* (1869).

GOBLET, gô'blâ', ALBERT JOSEPH, Count D'ALVIELLA (1790-1873). A Belgian general, born at Tournai. He fought at the battle of Waterloo, and was Minister of War after the Revolution of 1830, which post he exchanged in 1832 for the Ministry of Foreign Affairs. From 1837 to 1839 he was Ambassador to Portugal, where he became exceedingly popular as adviser to the young Queen, Maria da Gloria, from whom he received the title of Count d'Alviella. He was Minister of Foreign Affairs from 1843 to 1845, and exercised a considerable influence upon the public measures advocated in the Chamber. As a military engineer he planned the defenses of Northern Belgium and the extension of the fortifications of Antwerp. His principal publications are: *Des cinq grandes puissances de l'Europe dans leurs rapports politiques et militaires avec la Belgique* (1863), and *Dix-huit mois de politique* (2 vols., 1865).

GOBLET, RENÉ (1828-1905). A French statesman. He was born at Aire-sur-la-Lys, studied law, and practiced with great success at Amiens. Already distinguished for his democratic principles expressed in his paper, the *Progrès de la Somme*, at the fall of the Empire he became procureur-général at the Court of Amiens. In 1871 he was elected to the National Assembly, where he joined the Republican Left and was soon recognized as an orator of rare ability. In 1879 he was appointed Under Secretary of State for Justice. In 1876 he failed of reelection to the Chamber, but in 1877 and in 1881 he was again returned from Amiens, and in 1882 was appointed Minister of the Interior; but in the crisis brought about by the Egyptian question, and because of the attacks made upon the Ministry of Freycinet, he, with the other members, resigned. In 1884 M. Ferry was overthrown and M. Goblet was appointed Minister of Education and Public Worship in the Brisson Ministry (April, 1885), in which position he energetically continued his reform policy. He retained his portfolio in the Freycinet Cabinet, which went out of office in 1886, when he became Prime Minister. His Ministry, however, was overthrown in May, 1887, because of his unpopular efforts toward radical change in the municipal organization of Paris. In April, 1888, Goblet took the portfolio of Foreign Affairs in the Floquet Cabinet, but resigned with the former in February, 1889. He was elected Senator in 1891, and as such warmly supported anti-clerical measures, and, together with Lockroy, Sarrien, and Peytral, drew up a political programme of action of which the *Petite République Française* is the organ. From 1893 to 1896 he was again a member of the Chamber of Deputies, where he voted with the Radicals.

GOBLET D'ALVIELLA, dâl-vyê'lâ. EUGÈNE, Count (1846—). A Belgian historian of religion. He was appointed an instructor in the history of religion at the University of Brussels, was elected to the Belgian Chamber of Deputies as a Liberal from Brussels, and in 1892 to the Senate. In 1872 he visited the Sahara, and in 1875 accompanied the Prince of Wales, Albert Edward (now Edward

VII.), on the latter's journey to India. He also became a collaborator on the *Revue de Belgique*. In addition to descriptions of travel, *Sahara et Laponie* (Eng. trans., "Sahara and Lapland," 1874), *Inde et Himalaya*, and several other works, he published notably: *L'évolution religieuse contemporaine chez les Anglais, les Américains et les Hindous* (1884; Eng. trans. by Moden, "The Contemporary Evolution of Religious Thought in England, America, and India," 1885); *La migration des symboles* (1891; Eng. trans., "The Migration of Symbols," 1894), his most important volume, whose thesis is that "the religious symbols common to the different historical races of mankind have not originated independently among them, but have, for the most part, been carried from one to the other in the course of their migrations, conquests, and commerce"; and *Ce que l'Inde doit à la Grèce* (1897). His chief specific achievement is to have made the study of symbols a recognizedly valuable branch of archaeology.

GOBLINS (OF. *gobelin*, from ML. *cobalus*, Gk. *κόβαλος*, *kobalos*, rascal). Familiar demons of popular superstition which lurk about houses. They are also called hobgoblins, perhaps a corruption of hoggoblin. See DEMON.

GOBLINS, THE. A sparkling comedy, interspersed with songs and music, by Sir John Suckling, first acted at Blackfriars in 1638 and revived at the Theatre Royal, January 24, 1667. Tamoren, the chief of the 'goblins,' is a sort of Robin Hood, who terrorizes and metes out poetic justice in the Kingdom of France.

GOBO'NY. A term in heraldry. See COMPONÉ.

GOB'SECK. A novel by Balzac (1830), named after the character about whom its plot is centred, and who appears in others of Balzac's works as the type of the miser and usurer.

GOPY (from Lat. *gobio*, *gobius*, gudgeon, from Gk. *κόβιος*, *kobios*, gudgeon). A spiny-rayed fish of the family Gobiidae, whose ventral fins are completely united into a disk more or less capable of being used as a sucker, enabling the fish to cling to rocks and so resist the power of waves and currents. They have no air-bladder. The true gobies are generally small fishes, some of them inhabiting the shallow bays of the coast, and others deeper water; the species are very numerous, and belong to both hemispheres. One species (of Russia) inhabits fresh water alone. The gobies are very interesting, on account of their habits, and are of the number of nest-building fishes, employing seaweeds and eel-grass for this purpose in spring. When the female has deposited her eggs in the nest, the male watches over them till they are hatched. In Europe, consequently, these fishes are much in request for aquaria, of which they are among the most interesting occupants. A British species (*Gobius minutus*), which ascends rivers, chooses a cockle-shell for its home in some tidal pool. "The shell being placed on the sand with its concave surface downward, the sand beneath it is hollowed out and cemented by a special mucilaginous secretion from the skin; a cylindrical tunnel gives access to the nest, and the whole structure is covered over with loose sand." The female having glued her eggs to the shell, the male guards them for six to nine days, until they hatch. An-

other European goby (*Latrunculus pellucidus*), which is nearly transparent, is remarkable for being perhaps the most short-lived of all vertebrates, being born in midsummer, maturing during the following winter, and spawning and dying upon the approach of summer, so that none live more than a year. Small species of several genera inhabit the coast and estuaries of the Southern United States and of California. See MUDFISH.

GOCH, gög, JOHANNES VON (properly JOHANN PUPPER) (c.1400-75). A German Augustinian monk. He was born at Goch, Prussia, probably studied at Paris, and was the founder of an Order of Canonesses at Tabor, near Mechlin, Flanders, in 1451, of which he subsequently became prior. He may in some respects be considered a precursor of the Reformation, and in his writings, *De Libertate Christiana*, *De Quatuor Erroribus circa Legem Evangelicam*, and *Epistola Apologetica* (1521), he attacks the influence of Pelagianism in the Church, and advocates a return to the text of the Bible as the only true source of religious truth. He was considered a man of profound piety, and as a theologian was unexcelled in his day.

GÖCKINGK, gē'kīnk (also spelled GOEKINGK and GÖKINGK), LEOPOLD FRIEDRICH GÜNTHER VON (1748-1823). A German poet. He was born at Gröningen, and was educated at Halle. After occupying various official positions under the Government at Magdeburg, Wernigerode, and Berlin, and acting for several years as privy councillor to the Prince of Orange-Fulda, he in 1826 removed to Berlin, and subsequently to Wartenberg, Silesia. His *Lieder zweier Liebenden* (3d ed. 1819) won for him great popularity in Germany toward the close of the eighteenth century. His *Gedichte* (rev. ed. 1821) contain the excellent *Episteln* and *Sinnegedichte* (separately published, 2d ed. 1778). The latter are occasionally characterized by a vein of modern political satire.

GOD (AS., OS., Dutch *god*, Goth. *gub*, OHG. *got*, *cot*, Ger. *Gott*, of doubtful etymology, perhaps connected with Skt. *hū*, to call, or with Skt. *hu*, Gk. *χεῖν*, *chein*, to pour; the word is evidently originally a passive participle; the frequent derivation of *god* from *good*, AS. *gōd*, Goth. *gōds*, OHG. *guot*, Ger. *gut*, is entirely erroneous). The eternal and infinite personal Spirit, the Creator and Governor of the universe, unchangeable in His attributes, whose nature is love.

There are two widely differing views of the origin of the idea of God. The first is the older Christian view, that God revealed Himself to the fathers of the people of Israel by such personal communication of Himself as gave them a true, though not complete, view of Him as the only, infinite, and eternal God. The course of the history of this people was such that they gradually came to have a more adequate and stable view of God's nature and attributes, in connection with which their whole conception of truth and religion underwent a process of constant development. Finally, in Jesus Christ the perfect revelation of the Father appeared, and that form was given to all the elements in the idea of God which is now recognized as the highest to which man has attained. Thus the idea of God comes from God Himself, and its history undergoes such a development, and such a one only, as the im-

perfection and development of men has rendered necessary.

The second view is that which regards the idea of God as a purely natural development. As man develops from the animal world, he begins what may be called his human history, without the idea of God. There is, however, a tendency in him toward religion. His wants do not find perfect satisfaction in the world, and he experiences pain and hardship. He must seek help from some source, and the idea of some power or powers which can bestow this upon him arises in his mind by a 'psychological necessity.' Worship may begin in several ways, but probably by his appealing to the spirits of departed ancestors or to the great powers of nature, or both. The idea of gods once introduced, the tendency is toward a multiplication of gods, whence arises polytheism. A tendency soon becomes marked to ascribe to one God the control over some restricted portion of country, or over the affairs of one family. This produces a 'henotheism' within a restricted group of persons, which may be perfectly consistent with polytheism and polytheistic worship apart from the restricted circle to which this one God belongs. But with the growth of the family into a tribe, and of the tribe into a nation, the sphere of the god is also enlarged, and victories over other nations, as well as increasing intelligence about the world and what is in it, will produce ultimately the idea of one God, beside whom all other gods are only pretended gods, having no real existence. Thus monotheism must develop. This view may be said to be at present struggling for recognition as a truly Christian view. It draws its support very largely from the Old Testament Scriptures as interpreted by the representatives of modern higher criticism. The question between the two views may be reduced to the single issue whether there has taken place a supernatural interference in the course of history for the salvation of man, or whether the knowledge of God has arisen by the immanent and impersonal operation of God in nature and in the mind of man.

However the final idea of God may have come to Jesus of Nazareth, it is indisputable that it never emerged in any philosophy independent of Him (India, China, or Greece) and never has been developed since in independence of Him. All the proofs of the existence of God rest upon the idea of order in the world, and this idea is a Christian idea. It is faith, in distinction from a skepticism always possible and often very real. Under the guidance of this Christian element several distinct lines of proof have been presented which coincide in a single complex proof of the divine existence. The first proof is the so-called cosmological, from the mere existence of a dependent world, which does not bear in itself the marks of eternal and independent existence, to an independent something which shall be its cause. This leaves the doctrine in a very vague condition. The next proof adds definiteness to it, the teleological proof. In innumerable individual objects, like the plants, in the adaptations of the chemical elements to each other, the construction of the bodies of animals and of the mind of man, and in the whole universe as revealed more and more by modern study, we see evidences of plan. The Cause of the world is, therefore, capable of making a vast plan, or He possesses intelligence and will, that is, rational personality. The

moral proof argues from the nature of man himself, especially as a moral being, to the nature of God as also moral, or benevolent, which argument is supplemented by the Christian argument which draws the conclusion from the experience of regeneration that God positively seeks to promote the holiness of men. These arguments are completed by the ontological argument, which in its best form ascribes to the highest conception which man is able to form of God (the Christian conception) objective validity, on the basis of the proposition that it is fundamentally inconceivable that the highest conception at which the mind of man can arrive should be a mere subjective creation. These arguments do not so much display the path by which man has come to the knowledge of God, as serve dialectically to unfold its contents.

The modern objection to this line of proof began with Kant, who declared it to be an application of the principle of causality beyond the bounds set by nature as an intellectual principle given man for the knowledge of empirical objects. The sensational school, which Kant was opposing, have also denied the application of causality to reach beyond experience on various grounds. Mill was chiefly influenced by the complexity of the investigation, and particularly by the difficulties created by the existence of pain and sin. Spencer, who has carried this school to its natural results and combined a developed theory of evolution with sensationalism, has based his objections upon the doctrine of the relativity of knowledge, which makes such a conception as that of a first cause essentially unintelligible. In a more popular form the objection is raised against the idea of God that it is incapable of proof, by which is meant such proof as is given to the propositions of natural science, experimental and tangible proof.

It has sometimes been claimed that the idea of God is innate in the soul. If by this is meant that every man has by nature the idea of one infinite person, the claim is manifestly false, for the existence of polytheism at once disproves it. But if it be meant that there are innate in the mind certain principles, such as that of causation, which impel the mind to look up from phenomena to their source, and that the examination of all the phenomena belonging to this sphere will finally give to man the knowledge of God, the proposition in this sense is true. The argument is thus mingled of a *priori* and a *posteriori* elements. The former are necessary as the rational foundation of the argument, the latter to give it contents and to lead it to the concrete result of the being of God. See THEISM.

BIBLIOGRAPHY. Among the numerous excellent treatises of recent times upon theism may be mentioned as the best: Orr, *Christian View of God and the World* (London, 1897); Flint, *Theism* (London, 1886); id., *Anti-Theistic Theories* (Edinburgh, 1884); Martineau, *A Study of Religion* (Oxford, 1888); Harris, *Self-Revelation of God* (New York, 1887); Fiske, *Through Nature to God* (Boston, 1899).

GODARD, gô'dâr', BENJAMIN (1849-95). A French composer, born in Paris. He was a precocious child, and after studying the violin with Richard Hammer, entered the Paris Conservatory, where his teachers were Vieuxtemps (violin) and Reber (composition). In 1865 a violin

sonata was published, and shortly afterwards Godard received a prize from the Institut de France. From this time on, his compositions followed each other rapidly. While not works of genius, they are characterized by felicity of expression, and met with considerable popular favor. His most successful opera was *La Vivandière*, produced at the Opéra Comique shortly after his death. He also wrote: *Pedro de Zalaméa* (1884); *Jocelyn* (1888); *Le Dante* (1890); *Jeanne d'Arc* (1891); and numerous symphonies, suites, concertos, and songs.

GODAVARI, gô-dâ'vá-ré. One of the principal rivers of the peninsula of India, and the largest of the Deccan, rising within 50 miles of the Arabian Sea in the Western Ghats, near Dindori (Map: India, C 5). It flows southeast for 900 miles across the peninsula into the Bay of Bengal. Dividing at Rajamandry, it enters the sea by two principal mouths, the northern at the French town of Yanaon and the southern at Narsapur. About 23 miles above the head of the delta, the Godavari emerges near Rampa from the Eastern Ghats, through which it has passed with so moderate a descent as to be navigable in either direction for 300 miles. Its northern tributaries are the Purna, the Pranhita, the Indravati, and the Saveri; from the south it receives the Manjera and the Maner.

GODDARD, ARABELLA (Mrs. J. W. DAVISON) (1836—): An English pianist. She was born, of English parentage, in Brittany; studied in Paris under Kalkbrenner, and in London under Mrs. Anderson and Thalberg, and made her first public appearance in 1850 at the Grand National Concerts at Her Majesty's Theatre. She continued her studies under Davison, whom she married in 1860. Her most brilliant success was in her interpretation of the last compositions of Beethoven. In 1873-76 she made a successful tour of the world, including America, Australia, and India, and in 1880 retired from professional concert-giving.

GODDESS OF REASON. The new divinity set up by the French Revolutionists in their attempted reconstruction of religion in 1793. On November 10th, in the Cathedral of Notre Dame, changed into a Temple of Reason, the goddess was installed with much ceremony. The part of the goddess was taken by an actress, dressed in white and wearing the Phrygian cap and the tricolor. The cathedral was restored to its proper functions by Napoleon in 1802.

GODEBSKI, gô-dêb'ské, CYPRIEN (1835—). A Polish sculptor, a son of Xavier Godebski. He was born at Méry-sur-Cher, France, and was educated at the Polish school, Batignolles, and in the studio of Joffroy. He spent many years in Galicia and at Saint Petersburg. His principal works include: "Le Réveil," a marble statue (1886); "Enfants," a bronze group for a Polish school (1880); "L'ange de la patrie protégeant deux orphelins" (1884); "Force brutale étouffant le génie" (1889); and busts of Rossini, Vieuxtemps, Zichy, Servais, Prince Gortchakoff, Kraszewski, and others. He also executed a fine monument of the composer Moniuszko for the Warsaw Cathedral; a monument to the heroes of the Crimean War at Sebastopol, and various other monumental works.

GODEBSKI, XAVER (1801-69). A Polish author, born at Frankenthal, a son of Cyprian Godebski, the poet and patriot. He was for many years professor in a Polish school at Paris. His literary work includes the edition of his father's more important writings, works on politics and history, especially a life of Plater (1848), and the studies on social reform in Poland in the eighteenth century (1866), and on the spirit of the times (1860). He also translated several French plays into Polish.

GODEFROY, gô'd'frwâ (Lat. *Gothofredus*). The name borne by a family of distinguished scholars of French origin. The first of these, DENIS GODEFROY (1549-1622), was born at Paris, and after studying at Louvain under Ramus, completed his education at the universities of Cologne and Heidelberg. It was probably at this last place that he adopted Protestant tenets. In 1580 Godefroy quitted France and became a professor of law at Geneva. In 1589 he was made bailiff of the District of Gex, but his house having been pillaged and his library burnt by the troops of the Duke of Savoy, he retired first to Basel and later to Strassburg, where in 1591 he was given the chair of Roman law and history. In 1605 the Elector Palatine of the Rhine called him to be head of the faculty of law at Heidelberg. In 1618 he was sent as envoy to Paris from Frederick V. to Louis XIII. Though numerous offers were made to him, Godefroy preferred to remain at Heidelberg, but in 1621 the presence of the army of the Catholic League under Count Tilly forced him to seek refuge at Strassburg, where he died September 7, 1622. His most important work was his edition of the *Corpus Juris Civilis* (Geneva, 1583), which was long the standard text. He was also the author of numerous works on jurisprudence, and on the classics.—THÉODORE GODEFROY (1580-1649) was the eldest son of Denis Godefroy. In 1602, after being educated at Geneva and Strassburg, he settled in Paris and abjured Protestantism. Although an advocate before the Parliament of Paris, he devoted most of his time to the study of history and eventually became the historiographer royal of France. During the latter half of the Thirty Years' War he was employed as one of the French diplomats at Cologne and Münster, and helped negotiate the Peace of Westphalia in 1648. He died at Münster, October 5, 1649. He was the author of numerous works in French history and politics, and made a large and important collection of documents for the history of France, and of other countries. This was continued by his son DENIS (1615-81), and in 1749 found its way into the library of the Institut de France.—JACQUES GODEFROY (1587-1652), the younger brother of Théodore, passed his life as professor of law at Geneva, and remained true to his Protestant convictions. He is known as the editor of the *Theodosian Code* (Lyons, 1665), upon which he worked for twenty years, and which is still used by jurists. Besides this he published a multitude of works on law and jurisprudence, and he ranks higher as a scholar than even his learned father. Others of the Godefroy family who were distinguished in their time are: JEAN GODEFROY, Sieur d'Aumont (1656-1732), the third son of the younger Denis, and an historian of note; DENIS CHARLES GODEFROY, Marquis of Meulgiroire (1795-1877), the family biog-

rapher, and a scholar of ability. He published *Les savants Godefroy; Mémoires d'une famille pendant les XVIème, XVIIème et XVIIIème siècles* (1873).

GODEFROY, FRÉDÉRIC (1826—). A French literary historian. He was educated for the most part privately, and early devoted his leisure to the study of French language and literature. His *Lexique comparé de la langue de Corneille* (1862) was crowned by the Academy. He also wrote a *Histoire de la littérature française depuis le XVIème siècle jusqu'à nos jours* (2d ed. 1878-81). With governmental support he prepared the voluminous and important *Dictionnaire de l'ancienne langue française et tous ses dialectes du IXème au XVème siècle* (1880 et seq.). This work, laboriously compiled from all authoritative printed and manuscript sources, remains, despite certain defects, a standard reference-book.

GODERICH, göd'rich. See **RIPON**.

GODERICH. Capital of Huron County, Ontario, Can.; a port of entry on Lake Huron, at the entrance of Maitland River, and the terminus of the Buffalo and Goderich branch of the Grand Trunk Railway (Map: Ontario, B 4). It has a good harbor and steam communication with all lake ports, valuable fisheries, salt-refineries, iron-foundries, and machine-works. The United States is represented by a commercial agent. Population, in 1891, 3900; in 1901, 4158.

GODESBERG, gö'des-bërk. A summer resort in the Prussian Rhine Province, situated near the left bank of the Rhine, four miles below Bonn (Map: Germany, B 3). It has an alkaline chalybeate spring, believed to have been known to the Romans, a hydropathic establishment, and numerous fine villas with gardens. A short distance from the village lie the ruins of the Castle of Godesberg, erected by Archbishop Dietrich of Cologne in the thirteenth century. Population, in 1900, 8927.

GODET, gö'dä', FRÉDÉRIC (1812-1900). A Swiss Protestant theologian. He was born at Neuchâtel, and was educated in that city and at Bonn and Berlin. In 1850 he was appointed professor of theology at Neuchâtel, and in the following year received a pastorate which he held until 1866. In 1873 he became the founder of the Evangelical Church of Neuchâtel, which is independent of the State. As a prominent representative of Lutheran orthodoxy, Godet exercised a very wholesome influence on the development of religious thought in Switzerland, which was further stimulated by him in the works entitled: *Histoire de la réformation et du refuge dans le pays de Neuchâtel* (1859); *Commentaire sur l'évangile de Saint-Jean* (3d ed. 1881-88), which has been translated into English (1886), German, Dutch, and Danish; *Commentaire sur l'évangile de Saint-Luc* (3d ed. 1889); *Commentaire sur l'épître aux Romains* (2d ed. 1890; Eng. trans. 1883); *Etudes bibliques* (4th ed. 1889; Eng. trans., first part, *Old Testament Studies*, 3d ed. 1885, second part, *New Testament Studies*, 6th ed. 1885).

GODEY, LOUIS ANTOINE (1804-78). An American publisher. He was born and educated in New York City, and from 1830 to 1877 conducted a magazine at Philadelphia entitled *Godey's Lady's Book*, the first of its class in this country. Among his other publications were

Jarvis's Musical Library and the *Young People's Book*. All his publications were marked by a high moral tone.

GODFATHER AND GODMOTHER. The sponsors of candidates for baptism, and, in the Roman Catholic Church, of candidates for confirmation. See **SPONSORS**.

GODFREY, THOMAS (1704-49). A self-made American mathematician, who acquired some reputation from an improvement which he made in Davis's quadrant. (See **SEXTANT**.) He was a man of intemperate habits, a humble artisan in Philadelphia, but he was sufficiently interested in science to learn Latin that he might read the better class of mathematical literature of the time. The improvement in the quadrant seems to have been due to him, but there was a dispute between him and John Hadley of England as to the priority of the invention. The Royal Society considered the claims of both parties, and rewarded each, sending to Godfrey gifts to the value of a thousand dollars. The account in the *Philosophical Transactions* of the Royal Society of London (abridged edition, London, 1809, vol. vii., p. 667, for 1734) speaks of him as "having under the greatest disadvantages made himself master of the principles of astronomy and optics, as well as other parts of mathematical science," and as having made his invention in 1730, the first account of it appearing two years later.

GODFREY DE BOUILLON, de bö'vö's' (c.1058-1100). One of the leaders of the First Crusade and the first Latin ruler of Jerusalem. He was the son of Eustace of Boulogne and Ida, sister of Gozelo, or Godfrey, the Humpbacked, of Lower Lorraine. The year of his birth is uncertain, but it was about 1058. His family traced its descent from Charles the Great, and later legends made Lohengrin, 'the Knight of the Swan,' Godfrey's progenitor. In the strife over investiture (q.v.) he was on the side of the Emperor, and it was said that he was the first to scale the walls of Rome when it was attacked by Henry IV. in 1084. The legends also recount how he was stricken with disease because of his sacrilege at Rome, and then miraculously healed when he took the Crusader's vow. In 1089 he became Duke of Lower Lorraine. He was one of the leaders in the First Crusade (1096-99), but not commander-in-chief, and after the capture of Jerusalem was elected 'Baron and Defender of the Holy Sepulchre.' According to an untrustworthy legend, he was offered the title of King, but refused "to wear a crown of gold where the Saviour had worn a crown of thorns." He held this dignity for about a year, and died July 17 or 18, 1100. Godfrey is described as a man of large stature and great bodily strength. Many feats of bravery and strength are ascribed to him, such as his combat single-handed with a ferocious bear, or his cleaving asunder the body of a Moslem emir with a single blow of his sword. He made an excellent and energetic ruler of Jerusalem. Many legends clustered about his name, and many deeds were falsely imputed to him. Consult: Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1900); Froboese, *Gottfried von Bouillon* (Berlin, 1879). Hagenmeyer, *Gesta Francorum* (Heidelberg, 1890), gives a full bibliography of all the best works on Godfrey. See **ASSIZE OF JERUSALEM**; **CRUSADES**.

GODHAVN, gôd'häv'n. A town of Greenland, on the south coast of Disco Island. It is the residence of the Danish Inspector of the Northern Inspectorate, and has some fishing industries. Godhavn, also called Lieueuly, is mainly known in America as the stopping-place of many polar expeditions. Population, 213.

GODIN, AMÉLIE. See LINZ, AMÉLIE.

GODIN, gô'dân', JEAN BAPTISTE ANDRÉ (1817-88). A French socialist, born at Esquehéries, in the Department of Aisne. He came from an artisan family, and received the meagre education which was given to boys of his class at that time. When seventeen years old he began a trip through France, in order to perfect his skill as an artisan. Three years afterwards he was a workman in Esquehéries. A small workshop which he established in 1840 prospered, and in 1846 employed about thirty men. Then he moved to Guise, in order to find a better market for his wares. He found time to pick up a very fair education, and became deeply interested in the writings of certain socialists, especially Fourier. He gave material financial assistance to Victor Considérant, who attempted to put Fourier's system into practice near San Antonio, in Texas, and when that plan failed he resolved to try coöperation himself. He gradually introduced reforms into his workshops, such as payment of laborers by the hour instead of by the day. In 1859 he began the construction of the buildings for his co-operative association, or *familiatère*, and before 1886 had fully established profit-sharing. A part of the profits he laid aside as a common fund for education, sinking fund, and other similar purposes, and divided the remainder between labor and capital. Godin had some success in politics. He was elected president of the municipal commission of Guise in 1870, and member of the National Assembly in 1875. He published several books, the chief of which are: *Solutions sociales* (1871); *La politique du travail et la politique des privilèges* (1875); *La souveraineté et les droits du peuple; le gouvernement et le vrai socialisme en action* (1883); *La république du travail et la réforme parlementaire* (1889). His establishment now bears the name of Dequerme et Cie. Consult Bernadot, *Le familiatère de Guise et son fondateur* (Paris, 1889). See FOURIERISM.

GODIN, LOUIS (1704-60). A French astronomer, born in Paris. He studied at the College of Louis le Grand and under Delisle. On May 16, 1735, he started on an expedition to South America to measure a degree of the meridian by geodetic methods. He arrived at Quito, Peru, in February, 1736, established two astronomical stations in the Andes, and was subsequently appointed professor of mathematics at Lima, where, in 1746, he made important seismological studies during the famous earthquake. A year after his return to Europe, in 1752, he was appointed president of the naval academy at Cadiz, where he rendered valuable services during the earthquake of Lisbon. His principal works include: *Histoire de l'Académie des Sciences 1680 à '99* (1728); *El temblor de tierra de Lima, sus causas, efectos y consecuencias* (1748); *Observations astronomiques au Pérou* (1752); *Des tremblements de terre en général, de ceux de Lima et Lisbon en particulier* (1753); *Les possessions espagnoles de l'Amérique du Sud* (1755).

GODIN DES ODONAIS, dâ zô'dô'nâ', JEAN (1712-92). A French naturalist, born at Saint Amand, France. Early in his life he went to Peru, where he was appointed to the chair of natural science and astronomy at Quito (1739). Several years later he began a botanical exploration of Northern Peru and Ecuador, and afterwards removed to Cayenne, where from 1750 to 1765 he explored the neighboring country and Brazilian Guiana. From here he traveled along the Amazon, on the banks of which he made further botanical investigations during a period extending over eight years. On these journeys he prepared illustrations of hundreds of mammals and birds, many of them before unknown, and collected more than 10,000 species of plants. Returning to France in 1773, he gave his collections to the Museum of Natural History at Paris. His numerous publications, comprising works on the botany and languages of South America, include: *Flore raisonnée du Pérou* (1776), containing more than 4000 species, with two volumes of illustrations, in more than 700 plates; *Les plantes de la Guayane* (1777); *Faune du Pérou* (1778), with numerous illustrations; *Flore de la Guayane* (1779), with three volumes of illustrations; *Grammaire comparée des langues indiennes de l'Amérique du Sud* (1784).

GÖDING, gô'ding (Bohemian *Hodonin*). A town of Austria in Moravia, on the right bank of the navigable March, which here forms part of the Hungarian boundary. It is about 70 miles northeast of Vienna, and in an agricultural district (Map: Austria, E 2). The principal attraction is the Imperial castle, with its immense domain. There is a considerable trade in dressed lumber. Population, in 1890, 8482; in 1900, 10,231.

GODIVA, or **GODGIFU** (?c.1080). According to legend, a Saxon lady of Coventry, in Warwickshire, who rode naked through the streets of the town out of devotion for her people. It is impossible to say whether the story is wholly fictitious or partly true. In its developed form the legend runs as follows: About the year 1040, Leofric, Earl of Mercia and Lord of Coventry, imposed certain onerous services and heavy exactions upon the inhabitants of the latter, of which they loudly complained. His wife, the Lady Godiva, having the welfare of the town at heart, besought her husband to give them relief, and was so earnest in her entreaties that at length, to escape from her importunities, the Earl said he would grant her the favor, but only on condition that she would ride naked through the town, supposing, from the modesty of Lady Godiva, that he had imposed an impossible condition. He was surprised with her answer: "But will you give me leave to do so?" As he could not in justice refuse, she ordered that proclamation be made that on a certain day no one should be out of doors, or even look from their houses; and, clothed only in her long hair, she rode through the town. Her husband, in admiration of her intrepid devotion, performed his promise. This circumstance was commemorated by a stained-glass window, mentioned in 1690, in Saint Michael's Church, Coventry; and the legend that an unfortunate tailor, the only man who looked out of a window, was struck blind, has also found commemoration in an ancient effigy of 'Peeping Tom of Coventry,' still to be seen in a niche of one of the buildings. By a charter

of Henry III. (1218), a fair is held at Coventry, beginning on Friday of Trinity week, and lasting eight days. The fair was opened with a grand civic procession, a part of which was, in 1678, the representation of the ride of Lady Godiva. These processions were continued at intervals of from three to seven years until 1826. Some beautiful woman, who represented Lady Godiva, was the principal figure; but many other historical and emblematic personages were introduced. In 1848 the procession was revived with great splendor, and attracted 15,000 strangers. The ceremony has, however, fallen into disrepute, the last procession occurring in 1887. For a full discussion of the legend, consult Freeman, *The Norman Conquest* (Oxford, 1870-79).

GODKIN, EDWIN LAWRENCE (1831-1902). An American editor and publicist, born in Moyness, County Wicklow, Ireland. He graduated at Queen's College, Belfast, in 1851, and during the Crimean War (1854-56) was correspondent of the *London Daily News* in Turkey and Russia. In 1856 he came to the United States, where he read law under David D. Field (q.v.), was admitted to the bar in 1859, and for several years practiced in New York City. From 1862 until 1865 he was a correspondent of the *Daily News* and an editorial writer for the *New York Times*. In 1865 he established and became the editor of the *Nation*, a weekly periodical, which was fashioned after the *London Spectator*, and whose proprietorship was assumed in 1866 by himself, J. M. McKim, and F. L. Olmsted (q.v.). In 1881 the *Nation* was merged with the *Evening Post*, of which it became the weekly edition, and Godkin was thereafter an editor and proprietor of the combined publications. As a journalist he devoted little attention to the organization of newspaper service, and specifically was one of the foremost leader writers in the history of the American press. His editorials in the *Nation* from the first influenced in manifold ways the best thought of the time, and from 1884, previous to which the paper had been avowedly Republican, he made the *Evening Post*, of which he became editor-in-chief in 1883, the leading independent American daily. His style was noteworthy for its directness, its pith, and a certain effective humor. His critical estimates were singularly acute and mainly just. He was a prominent figure in reforms affecting the causes of sound money, of Reconstruction, and of the civil service. In him the idea of public office as a public trust had undoubtedly its chief exponent in the United States. He consistently and severely opposed the 'spoils' or close party system in American politics, as well as 'boss' or 'machine' rule in various forms. His fearlessness often exposed him to disapproval, and not seldom to abuse. In preparation for the New York City municipal campaign of 1890, he printed in the *Post*, with scathing editorial comment, a series of biographies of Tammany Hall leaders, which resulted in the issuance against him of several warrants of arrest on charges of criminal libel. The cases were dismissed for lack of prosecution. He received the degree of D.C.L. from Oxford University in 1897. He published a *History of Hungary, A.D. 300-1850* (1856); an excellent work on *Government* (1871), in the "American Science Series"; and *Reflections and Comments, Problems of Modern Democracy, and Unforeseen Tendencies of*

Democracy—all valuable collections of papers respectively from the *Nation*, the *Atlantic*, and other sources.

GODMAN, JOHN D. (1794-1830). An American physician, born in Annapolis, Md. He graduated at the University of Maryland in 1818, was professor of anatomy in the Medical College of Ohio, was one of the editors of the *Philadelphia Journal of Medical Science*, and in 1826-27 was professor of anatomy and physiology in Rutgers Medical College in New York. He was the author of many articles in the *Encyclopædia Americana*, and in addition published: *American Natural History; Anatomical Investigation* (1824); and *Rambles of a Naturalist*.

GODODIN. A seventh-century epic by the Welsh bard Aneurin, who was the son of the chief of the Gododin tribe, founded on the week's battle of Catterath (603). It is about 900 lines in length, and in 1852 was translated by Rev. John Williams, at Ithel. John Morley has also translated parts of it, and the poet Gray founded his "Death of Hoel" upon it. Consult Elton, *Origins of English History* (London, 1882).

GÖDÖLLÖ, gē'dē-lē. A market-town in Hungary, about 16 miles northeast of Budapest (Map: Hungary, F 3). It is chiefly noteworthy for its royal château, with an extensive park, formerly the property of the Princes Grassalkovich, but purchased in 1867 by the Hungarian nation and presented to the King on the occasion of his coronation. In the vicinity is Besnyő, a noteworthy pilgrims' resort. Population, in 1890, 4844. At Gödöllő, April 6-7, 1849, the Hungarians under Görgey defeated the Austrians under Windischgrätz. The victory led to the proclamation of Hungarian independence, April 14, 1849.

GODOLPHIN, SIDNEY, first Earl of (1645-1712). An English statesman. The third son of Sir Francis Godolphin, he was born at Helston, Cornwall, and was educated at Oxford, where he received the degree of M.A. in 1663. The previous year he was page of honor to Charles II., and in 1678 he became master of the robes. From 1668 to 1679 he was a member of Parliament for Helston, then two years for Saint Mawes. In 1679 he was one of the commissioners sent to Holland to negotiate the Peace of Nimeguen. Next year the Government appointed him a Lord of the Treasury, and in 1684 Secretary of State, with the title of Baron Godolphin of Rialton. Although his dislike of Roman Catholicism led him to vote for the exclusion of the Duke of York from the succession, on the Duke's accession as James II. Godolphin became chamberlain to the Queen, and afterwards the King gave him a place on the commission sent to treat with William of Orange. In 1690 William appointed him First Lord of the Treasury, and five years afterwards one of the seven lords justices for the administration of government during the King's absence. As Godolphin was guilty of secret correspondence with James II. at Saint Germain, he resigned his office in trepidation upon Sir John Fenwick's confession. When Fenwick was beheaded and his story discredited, however, Godolphin again became a Lord of the Treasury (1700). Appointed Lord Treasurer on the accession of Anne (1702), he remained head of the home Government during eight years, mainly through the influence of the Duke of Marlborough, whom Godolphin staunchly support-

ed with funds for the prosecution of the Duke's wars. In 1706 Godolphin was created Earl of Godolphin and Viscount Rialton. His position as head of the Whig Government came to an end in 1710, when he fell from power and was supplanted by Harley. He died two years afterwards at Saint Alban's. A man of remarkable intelligence and of businesslike habits, he was thorough in everything he did, and in an age of corruption he kept his hands pure. Consult: Elliot, *Life of Sidney, Earl of Godolphin* (London, 1888), very favorable; Collins, *Peerage* (9 vols., London, 1812); Evelyn, *Diary* (4 vols., London, 1879); Clarke, *Life of James II.* (2 vols., London, 1816); Macpherson, *Original Papers* (2 vols., London, 1775); Burnet, *History of His Own Time* (Oxford, 1833); and the various histories of England.

GODOLPHIN BARB, THE. The sire of the Matchem branch of thoroughbreds, foaled about 1729, and imported from Paris in the reign of George II. He died in 1753. In 1825 Eugène Sue founded a story upon his history. The sires of the other two branches of the thoroughbred are The Darley Arabian and The Byerly Turk.

GODON, SYLVANUS WILLIAM (1809-79). An American naval officer. He was born in Philadelphia; entered the navy as a midshipman in 1819; served in the Mexican War; and, in command of the *Mohican*, took part in the attack on Port Royal in 1861. In 1863 he became commodore, and in the attacks on Fort Fisher (q.v.) he commanded a division of Admiral Porter's fleet. He was made rear-admiral at the close of the war; commanded the South Atlantic Squadron in 1866-67; was commandant of the Brooklyn Navy Yard in 1867-70; and was retired in 1871.

GODOWN' (Malay *gadong*, *godong*, warehouse). A term applied in the East Indies to a storehouse or building located on a wharf and chiefly used for the storage of goods.

GODOWSKI, gô-dôv'skê, LEOPOLD (1870-). A Polish-American pianist. He was born at Vilna, in Russian Poland, and received his first instruction from local teachers. From 1881 to 1884 he was student at the High School of Music, Berlin, coming from there to America on an extended concert tour (1884-85). From 1886 to 1890 he studied with Saint-Saëns in Paris. During the next two years he made his second tour of America. In 1902 he became director of the pianoforte department of the Chicago Conservatory, and continued to sustain his reputation as one of the most successful concert pianists in America. He has published several instrumental compositions and a few songs.

GODOY, gô-dô'ê, MANUEL DE, Duke of Alcudia (1767-1851). A Spanish statesman. He was born at Badajoz, and at the age of twenty entered the King's bodyguard at Madrid, where his personal attractions gained him the favor of Charles IV., and of his Queen, Maria Luisa. He became lieutenant-general and Duke of Alcudia in 1792, and in the following year was made Prime Minister. He immediately plunged into war with France, which resulted disastrously for Spain, and was concluded by the Treaty of Basel in 1795, which procured for Godoy the title of Prince of Peace. He was also made a grandee of the first class, and received a gift of large estates. Though forced to resign the office of Minister in 1798,

he nevertheless remained the principal power in Spanish politics. Concluding an alliance with France against Portugal, Godoy invaded that country in 1801, and by the Peace of Badajoz forced Portugal to cede part of its territory to Spain. In 1804 he was made generalissimo of the Spanish forces on land and sea. The ill success of the war against England, culminating in the defeat of Trafalgar, stirred up great popular hatred for Godoy, and he had to contend also with the hostility of the nobles, who were envious of his sudden elevation. The Crown Prince Ferdinand placed himself at the head of a Court faction, and Godoy's attempt to stir up the King against the Prince only served to excite popular feeling. When Godoy, upon the invasion of Spain by the French troops in 1808, prepared to escape with the King and the Queen to Mexico, an insurrection broke out at Aranjuez. The King was forced to imprison the hated Minister to save his life from the mob. Napoleon, who wished to make use of Godoy in his raid on the Spanish crown, summoned him to Bayonne, where he signed Charles's act of abdication in favor of his son Ferdinand. (See CHARLES IV.; FERDINAND VII.) The latter part of his life was spent at Rome, and, after 1830, in Paris. Reduced to straitened circumstances for a long time, he received back part of his confiscated property in 1847, together with his titles. He died in Paris, October 7, 1851. His memoirs were published in French by Esménard (Paris, 1836). Consult Ovila y Otera, *Vida política y militar de D. M. Godoy* (Madrid, 1844).

GOD SAVE THE KING (or **QUEEN**). The national anthem of Great Britain, of which the music by adoption is that of several of the German States. It is played and sung in every part of the British Empire alike on solemn and festive occasions. Its origin has long been a subject of controversy. The contentions that it is of French or Scotch origin have been disproved, but no definite conclusion has been reached respecting the claims of Henry Carey (1696?-1743) to its authorship. He is credited with having composed both words and music about 1740, though he never claimed the song as his, and though none of his friends put forward such a claim until his son, some fifty years later, petitioned the Government for a pension on the ground that his father had written the hymn. The evidence which he adduced in support of this was purely circumstantial, and the petition was refused. On the contrary, there are traces of the existence of the song, or a similar one, long before Carey's time. A Latin hymn, "O Deus Optime," which still exists, and whose words are a counterpart of the present hymn, was sung in 1740. As for the music, John Bull (c.1563-1628) wrote an 'ayre,' still existing, which is identical in rhythm and similar in melody to "God Save the King." The hypothesis, backed by considerable circumstantial evidence, is that the above Latin words, or their prototypes, were written in 1688, and set to Bull's 'ayre' by their author. There is record of such a hymn having been sung in King James's Chapel. The song would naturally be preserved by the Stuarts, and the music, passing through various popular transformations, would ultimately reach its present form. It will be seen that this theory does not preclude Carey from having translated the words and given the final shape to the music.

The words and music were first published anonymously in the *Harmonia Anglicana* (1742), and appeared in the *Gentleman's Magazine* (1745). It has been chosen for a national air in Germany, where it is sung to the words *Heil dir im Siegerkranz*, and it was sung in Russia until the new anthem was written in 1833. In the United States it has long been known as the air to which "My Country, 'Tis of Thee" is sung. Consult: Bateman, "The National Anthem," in the *Gentleman's Magazine*, vol. cclxxv. (London, 1893), and Hadden, "The 'God Save the Queen' Myths," in *Argosy*, vol. lxxii. (London, 1900); Cummings, *God Save the King* (London, 1902); also Chappell, *Collection of National Airs* (London, 1838-40). See NATIONAL HYMNS.

GOD'S FOOL. A novel by Maarten Maartens (1892), considered by the author his masterpiece. The fool, Elias Lossel, by accident in childhood became blind, deaf, and obscured in mind. In spite of all, he had a sweet and loving nature. Handsome and wealthy, he was at last the victim of his half-brother's greed. The story gives a realistic picture of life in a small Dutch city.

GOD'S TRUCE. See TRUCE OF GOD.

GODTHAAB, góthab (Dan., good hope). A town and harbor of Greenland, on the west coast, the capital of the Danish Southern Inspectorate and the residence of the Danish Inspector. It was founded by Hans Egede in 1721, and is the oldest colony in Greenland. Population, 946.

GODUNOFF, gódy-nóf, BORIS (c.1551-1605). A czar of Russia. He became to all intent regent during the reign of Feodor I. (1584-98). In 1591 he is said to have caused the murder of the Czarevitch Demetrius, and in 1598, upon Feodor's death, was elected to the throne. He had previously (1591) defeated the Khan of the Crimean Tatars, and in 1589 effected the separation of the Russian Church from the Patriarchate of Constantinople. As Czar he appears to have been in the main clement and progressive; but the favor shown by him to foreigners and numerous innovations introduced by him resulted in considerable popular discontent. Thus Southern Russia was prepared to revolt to the standard of the first false Demetrius in 1604. Godunoff's history has been utilized by Pushkin in a drama of the name, for a German rendering of which consult von Bodenstedt's translation of the complete works of that author (vol. iii., Berlin, 1855).

GODWIN, or **GODWINE** (?-1053). An earl of the West-Saxons. Nothing is known definitely of him until 1018, when he is described as *dux* or earl. About 1020 he was Canute's most powerful official. More than any other person he contributed to the elevation of Edward the Confessor to the English throne, and from that time Godwin was the head of the national party, as opposed to the Norman Court favorites. He was Earl of Wessex, and enormously wealthy; his son Swegen was Earl of Hereford, Gloucester, and Oxford; his son Harold was Earl of East Anglia; his wife's nephew, Beorn, was Earl of Hertfordshire and Buckinghamshire; and his daughter Edith was Edward's Queen. As the Norman party became powerful, Godwin's influence over the King declined. The crimes of his son Swegen, who was outlawed for the seduction of an abbess and the murder of his cousin Beorn, weakened his position. Finally in 1051, when

Godwin refused to obey the orders of Edward, to punish the citizens of Dover on account of complaints of ill treatment made by the Normans, he lost the King's favor, was outlawed, and fled to Flanders. Godwin attempted to treat with the King, but finding this of no avail, resorted to violence, encouraged in this by the promises of support extended him everywhere in England. In September, 1052, he sailed up the Thames with a strong fleet and was enthusiastically received by the people. The King yielded, and on September 15th restored to him and his family all his property which had been confiscated. Soon after Godwin became ill, and died, April 14, 1053. Consult: Freeman, *The Norman Conquest*, vols. i. and ii. (Oxford, 1870-79), for a favorable view of Godwin; and Green, *The Conquest of England* (London and New York, 1883), for a rather unfavorable estimate.

GODWIN, FRANCIS (1562-1633). An English bishop and author, born at Hannington, Northamptonshire. He studied at Christ Church, Oxford, where he graduated in 1580, took orders, and became rector of Sampford, and afterwards Vicar of Weston-in-Zoyland and subdean of Exeter (1596). His *Catalogue of the Bishops of England* (1601) attracted the attention of Queen Elizabeth, who made him Bishop of Llandaff. In 1617 he was transferred to the see of Hereford by James I. He revised his *Catalogue* several times (1615 and 1616), and also wrote *Rerum Anglicarum Annales* (1616). The best known of his works is *The Man in the Moone, or a Discourse of a Voyage Thither by Domingo Gonsales, the Speedy Messenger* (1638), written while he was in college. It is supposed to have influenced Cyrano de Bergerac's *Voyage to the Moon*, as it was translated into French by J. Baudoin (1648), and traces of it seem to appear in parts of *Gulliver's Travels*.

GODWIN, MARY WOLLSTONECRAFT (1759-97). An English miscellaneous writer. She was born at Hoxton, near London, April 27, 1759, and was of Irish descent. Her mother died in 1780, and owing to the brutality of her father, Mary and her sisters were compelled to leave his house. Mary earned her living as school-teacher and governess until 1788, when she settled in London and was employed by Johnson the publisher as reader and translator. While at Paris in 1792 she met Gilbert Imlay, an American merchant and author. After bearing to him a daughter she was deserted. On March 29, 1797, she married William Godwin, and became the mother of Mary, the future Mrs. Shelley. She died September 10, 1797. The outline of her career contributed to the plot of Mrs. Amelia Opie's *Adeline Mowbray* (1804). Mrs. Godwin was one of the 'advanced women' of her time. Her most notable work is *Vindication of the Rights of Women* (1792). She attacked Rousseau's ideal woman, the heroine of novels and boarding-schools. She advocated the establishment of Government day schools, and maintained the right of women to enter the professions and politics. In short, her thesis was the equality of the sexes. Among her other works are: *Thoughts on the Education of Daughters* (1787); *Original Stories from Real Life* (1788); *Vindication of the Rights of Men*, a letter to Burke (1790); *Posthumous Works*, containing "Wrongs of Women," fragment of a novel, and "Letters and Miscellaneous Pieces" (4 vols., 1798). Consult: Godwin, *Memoirs of the Author*

of a *Vindication of the Rights of Women* (London, 1798); Paul, *Mary Wollstonecraft: Letters to Imlay*, with memoir (London, 1879); and Pennell, *Life of Mary Wollstonecraft* (Boston, 1884).

GODWIN, PARKE (1816-1904). An American journalist and author. He was born in Paterson, N. J., February 25, 1816, and after graduating at Princeton in 1834, practiced law for a short time in Kentucky, but after 1837 was for many years in the main connected with the New York *Evening Post*, of which the poet Bryant, his father-in-law, was for so long chief editor. Godwin conducted in 1842 a weekly, the *Pathfinder*, contributed much to the *Democratic Review*, was one of the editors of *Putnam's Magazine*, deputy collector in the New York Custom House under President Polk, and an early member of the Republican Party, though a consistent advocate of free trade. Two volumes of essays from *Putnam's Magazine* are gathered in *Out of the Past* (1870). Among his numerous other publications may be mentioned: *A Popular View of the Doctrine of Fourier* (1844); *Democracy, Civic and Constructive* (1844); *Vala: A Mythological Tale* (1851); *Political Essays* (1856). Godwin compiled a *Handbook of Universal Biography* (1851), and *Cyclopædia of Biography* (1863). He edited the *Works of W. C. Bryant*, with a *Life* (1884), and made translations from the prose of Goethe, Fouqué, and Zachokke. He also wrote an ingenious but rather erratic *New Study of Shakespeare's Sonnets* (1901).

GODWIN, THOMAS (1587-1642). A Church of England scholar. He was born at Wookey, Somersetshire, educated at Oxford; was rector of Brightwell, Berkshire, and died there March 20, 1642. He is remembered for his English treatise on Roman antiquities, with the Latin title *Romanæ Historiæ Anthologia* (1614); and *Moses and Aaron, or Civil and Ecclesiastical Rites Used by the Ancient Hebrews* (1625).

GODWIN, WILLIAM (1756-1836). An English novelist and political writer. The son of a dissenting minister, he was born at Wisbeach, Cambridgeshire, March 3, 1756. After studying at the Hoxton Presbyterian College, he became minister at Ware in Hertfordshire, and in 1780 minister at Stowmarket in Suffolk. Having been shaken in his religious belief, he gave up preaching in 1783, and by 1787 he was 'a complete unbeliever.' He was already devoting himself to literature. After a *Life of Chatham* (1783), *Sketches of History, in Six Sermons* (1784), and considerable hack-work, he published the famous *Enquiry Concerning Political Justice* (1793), in which were presented the most radical theories of French philosophy on morals and government. By this book he is best known. It was followed by *The Adventures of Caleb Williams* (1794), a remarkable novel, intended to illustrate the political views advanced in the *Political Justice* and by *The Enquirer* (1797), a collection of essays on morals and politics. In 1796 he formed an alliance with Mary Wollstonecraft (q.v.). After some months they yielded so far to custom as to be married. His wife died a short time after, in giving birth to a daughter, the future wife of the poet Shelley. In 1799 he published a successful romance entitled *Saint Leon*. In 1801 he married a Mrs. Clairmont. To secure a more certain support, Godwin and his wife started in 1805 a small publishing business, but he also worked indefatigably with his pen to the end of

his life. He wrote many school books; *Life of Chaucer* (1803); *Fleetwood*, a novel (1805); *Mandeville*, a novel (1817); *Of Population* (1820), a reply to Malthus; *History of the Commonwealth of England* (1824-28); *Cloudesley*, a novel (1830); *Thoughts on Man* (1831); *Deloraine*, a novel (1833); and *Lives of the Necromancers* (1834). As he grew old, he modified his opinions on politics and society, and especially on marriage, which he warmly commends in some of his later works. Many of his books were translated into foreign languages. He died in London, April 7, 1836. Consult: Paul, *William Godwin: His Friends and Contemporaries* (London, 1876); Hazlitt, essay in the *Spirit of the Age* (London, 1825); and Stephen, *English Thought in the Eighteenth Century* (London, 1876).

GODWIN-AUSTEN, göd'win-ās'ten. One of the highest mountain peaks in the world, situated in the Mustagh range of Northern Kashmir (Map: India C 1). It was named after Lieutenant-Colonel Godwin-Austen of the Trigonometrical Survey of India. Its altitude is placed at 28,265 feet.

GODWIN-AUSTEN, HENRY HAVERSHAM (1834-). An English topographer and geologist. He was born at Teignmouth, the son of Robert A. C. Godwin-Austen (q.v.). He was educated at the Royal Military College, Sandhurst, obtained a commission in the Twenty-fourth Regiment of Foot in 1851, and joined it in India in the following year. He served with distinction in the Second Burmese War, and after its close became an assistant topographer in the East Indian Trigonometrical Survey. In 1857 he was connected with the Government Survey in Kashmir, where he made the discovery of the important Baltoro glacier at the head of the Shigar River. In 1862-63 he conducted surveys in Ladakh, making thirteen ascents of mountain peaks, among them that of Mata, 20,607 feet high. He served in the Bhutan campaign in 1874, and took part in the expedition against the Daffas in the Eastern Himalayas. He retired from the army in 1877 with the rank of lieutenant-colonel. He was elected a fellow of the Royal Society. His writings include numerous important articles and monographs for various scientific magazines and society reports. His most important work is *On the Land and Fresh Water Mollusca of India* (1882-99), a monumental work in nine parts.

GODWIN-AUSTEN, ROBERT ALFRED CLOYNE (1808-84). An English geologist, born near Guildford, the son of Sir H. E. Austen. He was educated at Midhurst School, at a military college in France, and at Oxford, where, after graduation, he was elected a fellow of Oriel College. Here he studied geology under William Buckland. In 1833 he married a daughter of Gen. H. T. Godwin, upon whose death in 1854 he prefixed, by royal license, the name of Godwin to his own. His geological studies and discoveries, covering a period of more than half a century, were extensive and valuable, and his contributions to geological literature were considered authoritative, particularly the result of his investigations in Devonshire. He edited, as literary executor, the *Memoir on the Fluvio-marine Tertiaries of the Isle of Wight* (1856), left by Edward Forbes in manuscript; and completed the *Natural History of the European Seas*

(1859), begun by the same author. In addition to these, he wrote numerous original articles and notes in various geological journals. He was made a fellow of the Geological Society of London in 1830, a fellow of the Royal Society in 1849, and was twice president of the Geological Section of the British Association.

GODWIN'S OATH. A proverbial expression for a false oath, originating in the story that Godwin, Earl of Kent, was choked to death by a piece of bread while calling Heaven to witness his innocence of the murder of Alfred, the brother of Edward the Confessor.

GODWIT (of doubtful etymology; possibly from A.S. *gōd*, good + *wit*, wit; hardly from *gōd*, good + *wiht*, wight, creature, or from *god*, God + *wit*, wit, or *wiht*, wight, creature). A genus (*Limosa*) of large curlew-like shore-birds of the snipe family (*Scolopacidae*), with very long bill, slightly curved upward, and long slender legs. All the species frequent marshes and shallow waters, often those of the seacoast, where they seek their food by wading and plunging the long bill into the water or mud like snipes. They sometimes also run after small crustaceans or other animals, and catch them on the sands from which the tide has retired. All are noted for their loud, yelping cries. Two species belong

BILL OF MARBLED GODWIT.

to North America—the great marbled godwit (*Limosa fedoa*), and the Hudsonian godwit (*Limosa hæmastica*). Neither is very numerous, and both are visible only when passing back and forth from their northern breeding haunts to their tropical winter homes; the marbled godwit, however, nests in Iowa and northward. The general hue of these birds is rufous or cinnamon, the marbled godwit being paler than the Hudsonian, but both vary greatly with age, sex, and season; the former has the reddish tail barred with black and without any white, while the latter has a black tail broadly white at the base. The females are uniformly larger than the males. Godwits build their nests anywhere on the ground, not necessarily near water, and lay three and four eggs, olive drab spotted with umber brown. Four or five other species of godwit are found in the Old World. The flesh of all is good, and in Elizabethan England it was regarded as an expensive delicacy, often celebrated in the prose and verse of the period. The incessant pursuit of this bird, particularly by netting on the fens, nearly exterminated it in Great Britain. It is taken by gunners whenever encountered, but is not much sought after nor especially valued either for sport or food. See Colored Plate of SHORE-BIRDS.

GOEBEL, gē'bel, WILLIAM (1856-1900). An American politician. He was born in Sullivan County, Pa., and removed to Covington, Ky., in early boyhood. He began the study of law in 1873, and was admitted to the bar. He won a reputation as a trial lawyer, and as a political speaker and leader in the Democratic Party, and in 1887 was elected to the Kentucky State Senate, to which body he continued to be reelected at every election up to and including 1898. He was

active in building up a political machine, was unscrupulous in his methods, and aroused much bitter personal antagonism, particularly among the old-time leaders of the party. One of his personal quarrels culminated in his shooting and killing Col. John D. Sandford, for which he was acquitted on the grounds of self-defense. In 1897 he secured the passage of a bill of which he was the author, relieving the courts of all power in the appointment of election officials, and creating a State election commission of three members, to be chosen by the Legislature, not necessarily bi-partisan, which should have the power to appoint local boards on the same principle. By this act, known as the 'Goebel law,' it was hoped to wrest the control of the State from the Republicans, and to assure Democratic ascendancy for all time to come. The bill was passed over the veto of Governor Bradley (Republican), and was held constitutional by the State Supreme Court in December, 1898. In 1899 Goebel set out to secure the Democratic nomination for Governor, and after an exciting and bitter canvass was nominated in June. Seceding Democrats, however, placed in nomination John Young Brown, and the election resulted in the choice of W. S. Taylor, the Republican candidate, by about 2300 votes. After the convening of the Legislature, January 1, 1900, Goebel began a contest. The matter was referred to a legislative committee which it was understood was about to report in Goebel's favor, when, on January 30th, he was shot, while standing in front of the State Capitol, by an assassin concealed in a neighboring building, doubtless as the result of the political quarrel in which he was involved. The Democratic members of the Legislature immediately declared him Governor, and the oath of office was administered to him on January 31st. He died on February 3d.

GOEBEN, gē'ben, AUGUST VON (1816-80). A German soldier. He was born at Stade, in Hanover, entered the Prussian military service at the age of seventeen, but in 1836 went to Spain as a partisan of Don Carlos, and took an active part in the fighting between 1836 and 1840, being repeatedly wounded and twice taken prisoner. After the end of the Carlist War he returned to Germany, and wrote an account of his Spanish experiences, entitled *Vier Jahre in Spanien* (1841). Reëntering the Prussian Army, where he served on the staff, he took part in the campaign against the revolutionists in Baden in 1849, and became, in 1855, chief of staff of the Fourth Army Corps. In 1860 he was Prussian attaché with the army of the Spanish General O'Donnell, in the campaign in Morocco. In 1864 he took a prominent part in the war against Denmark, and became, in the following year, lieutenant-general and commander of the Thirteenth Division. At the head of this division he first entered Hanover in the war of 1866, and then fought successfully at Kissingen and other places in Bavaria. In the Franco-German War, as commander of the Eighth Army Corps, he distinguished himself at Saarbrücken and Gravelotte, and took part in the siege of Metz. In January, 1871, Goeben was appointed commander of the First Army Corps, and fought a decisive battle at Saint Quentin (January 19th), when he defeated General Faidherbe, and caused the disbanding of the French Army of the North. Besides the excellent account of his experiences in Spain, Goe-

ben wrote valuable articles in military journals on the wars of 1866 and 1870-71.

GOEDEKE, gē'de-ke, KARL (1814-87). A German historian of literature. He was born at Celle, and was educated at Göttingen, where he was professor from 1873 until his death. He was a remarkably prolific author, and after writing several novels and the drama *König Kodrus, eine Missgeburt der Zeit*, under the pseudonym of Karl Stahl, devoted himself to critical and biographical literature. The long list of his publications includes: *Deutschlands Dichter von 1813 bis 1843* (1844); *Elf Bücher deutscher Dichtung von Sebastian Brant bis auf die Gegenwart* (1849); *Deutsche Dichtung im Mittelalter* (2d ed. 1871); and *Grundriss zur Geschichte der deutschen Dichtung* (2d ed. 1884 et seq.), his principal work. His biography of Goethe is well known.

GOEKINGK, gē'kēŋk, LEOPOLD FRIEDRICH GÜNTHER VON. See GÖCKINGK.

GOERCKE, gēr'ke, JOHANN (1750-1822). A German physician, born at Sorquitten, East Prussia. He entered the Prussian Army as a surgeon at the age of seventeen, and in 1789 was appointed one of the three chief surgeons in the army. Meanwhile he had traveled extensively in Austria, Italy, France, and in England, where he entered into friendly relations with John and William Hunter, Bell, Cooper, Hamilton, and other equally celebrated surgeons. In 1797 he was appointed chief surgeon of the Prussian Army, in which capacity he rendered invaluable services during the various campaigns terminating with the battle of Waterloo. He founded several educational institutions for military surgeons, the most important of which was the celebrated *Pepinière*, afterwards known as the *Medicinisch-Chirurgisches Friedrich-Wilhelms-Institut*. His literary works include: *Pharmacopœia Castrensis Borussia* (1805); and *Beschreibung der Krankentransportmittel bei der königlich-preussischen Armee* (1814).

GOËS, gō'ash, BENITO DE, or BENTO DE (1562-1607). A Portuguese traveler and Jesuit priest. He was born on the island of San Miguel, one of the Azores, and until his twenty-sixth year led the life of an adventurer in the East Indies. In 1588 he entered the Order of Jesus, and in 1603 was sent on a mission to the Great Mogul, and thence to Cathay. At the Court of the Emperor Akbar he acquired an extensive knowledge of the geography of Asia, ascertaining after his arrival at Su-chau (1605), on the Chinese frontier, that Cathay and China were identical. His interesting notes and observations were published after his death by the Italian Jesuit missionary Matteo Ricci. Many translations into German, French, and English were also made, one of them entitled: *The Report of a Mahometan Merchant which had been in Cambalu, and the Travels of Bento de Goës . . . from Lahor to China by Land* (1625).

GOES, DAMIÃO DE (1501-73). A Portuguese historian and diplomat, born at Alemquer (Estremadura). King John III. of Portugal sent him on several important diplomatic missions to Flanders (1523), Poland (1529), Denmark and Sweden (1531). He then spent several years in Italy. In the defense of Louvain in Flanders against the French (1542) he was taken

prisoner. Upon his return to Portugal he was given charge of the archives, but his ideas were too advanced for the age. He was dispossessed of his office by the Inquisition in 1571, and was imprisoned, and died in obscurity. Among his works are: *Legatio Magni Imperatoris Indorum Presbyteri Joannis* (1518); *Legatio David Æthiopie Regis, ad Clementem Papam VII.* (1533); *Damiani a Goes Commentarius Rerum Gestarum in India* (1539); *Hispania* (1542); *De Bello Cambratico Ultimo* (1547); *Chronica do felicissimo rey D. Manuel* (1556-57); and *Chronica do principe D. Joan* (1567).

GOES, gōōs, HUGO VAN DER (?-1482). A Flemish painter. He was born in Ghent, but is spoken of as a painter of Bruges. He studied with Jan van Eyck. In 1468 he was employed on the decorations for the marriage festivities of Margaret of York and Charles the Bold, because of his special talent for designing escutcheons, flags, and wall-hangings. The records of the Guild of Ghent show his appointment as elder in 1472, and in 1476 he entered a brotherhood near Brussels, in the monastery of Rooden Cloestere. Frequent revels brought his life to a sad end in 1482. He was "the earliest master of the school who painted blue draperies broken with green." His execution is careful in drawing and his painting is solid. There is but one authentic painting by him, the "Nativity," in the Church of Santa Maria Nuova, Florence.

GOES, JAN ANTONISZ (Latin form, JOANNES ANTONIDES) VAN DER (1647-84). A Dutch poet, born at Rotterdam. Owing to the success of his first efforts at poetic composition, he found a patron in a wealthy gentleman of Flushing, who paid for his education at Utrecht, where he studied medicine. Afterwards he became a member of the Admiralty at Rotterdam. Goes was a poet of considerable power, and may in many respects be regarded as the last of the Dutch classics. He was very precocious, and before the age of twenty-five eulogies had already been written in his honor by Kaspar Brandt, Vollenhove, Huygens, Oudaeu, Vondel, and other distinguished authors. One of his best productions is *De Ystroom* (1671). The poem entitled "Bellone aen Bant," celebrating the peace between France and Holland, also occupies a very high rank in Dutch literature.

GOES, gō'ash, PERO DE (1503-54). A Portuguese pioneer, born in Lisbon. He conducted Martin Alfonso de Sousa's expedition to Brazil in 1530. Two years afterwards he received a strip of territory on the coast, and here he first successfully introduced the cultivation of sugarcane. His plantation was subsequently destroyed by the Indians, and Goes went abroad to secure the assistance of the King in suppressing the native uprisings. He was thereupon appointed to assist the newly appointed Governor-General, Sousa, and contributed greatly to the pacification of the country and the establishment of organized government. He is said to have been the first to bring specimens of the tobacco-plant to Europe (1547).

GOES, gōōs, or TERGOES, tēr'gōōs. A seaport of Holland, situated on the island of South Beveland, about 3¼ miles from its northern coast and 23 miles west of Bergen-op-Zoom (Map: Netherlands, B 3). The town has a fine Gothic church, dating from 1442, and the re-

mains of an ancient castle of Jacqueline of Bavaria. It has a harbor formed by a canal communicating with the East Scheldt, ship-building docks, and an active trade in hops, salt, and grain. Population, in 1889, 6600; in 1899, 7000.

GOESSMANN, gēs'mán, CHARLES ANTHONY (1827—). An American chemist. He was born at Naumburg, in Hesse, and was educated at Göttingen, where he became assistant in the chemical laboratory and (1855) privat-docent. In 1857 he came to America; was chemist and superintendent of a Philadelphia sugar-refinery until 1861, and then accepted a position with a Syracuse salt company. While in this position (1861-69) he spent one year (1862-63) as professor of chemistry in the Rensselaer Polytechnic Institute. In 1869 he became professor of chemistry in the Massachusetts Agricultural College at Amherst, and also chemist to the State Board of Agriculture. Goessmann traveled in Cuba and in Louisiana, Michigan, and Canada. His writings include: *Chemical Composition of the Brines of Onondaga* (1862); *Brines of Michigan* (1862-63); *Best Mode of Manufacturing Coarse or Solar Salt from the Brines of Onondaga* (1863); *Mineral Springs of Onondaga* (1866); *Salt Deposits of Petite-Anse, La.* (1867); *Salt Resources of Goderich, Canada* (1868); *Application of Caustic Magnesia for Sugar Refining* (1864); *Manufacture of Sugar in Cuba* (1865); besides chemical articles in Liebig's *Annalen der Chemie* (vols. lxxvii., lxxxix., xc., xcii., xciv., xcvii., xcvi., xcix., c., ci., civ.) and in *Silliman's American Journal of Science* (vols. xlv. and xlix.), on chemistry of salt and of brines, and agricultural contributions to the *Reports of the Massachusetts and New York Boards of Agriculture*, the *Transactions of the New York Agricultural Society*, and the *Reports of the Trustees of the Massachusetts Agricultural College*.

GOETHE, gō'te, AUGUST VON (1789-1830). The son of Johann Wolfgang von Goethe (q.v.). He was born at Weimar and occupied the position of chamberlain to the Grand Duke of Saxe-Weimar. He died October 27, 1830, while visiting Rome. By his marriage with the Baroness Ottilie von Pogswisch, a highly accomplished woman, he had three children, of whom WALTHER WOLFGANG (1818-85) was known as a composer of operettas and songs, while his younger brother, WOLFGANG MAXIMILIAN (1820-83), was a jurist and poet.

GOETHE, JOHANN WOLFGANG VON (1749-1832). The greatest German writer and one of the greatest of the world, excelling in every literary genre, distinguished in many branches of science and in literary and artistic criticism. He was born in Frankfort-on-the-Main, August 28, 1749. Both his parentage and the place of his birth were significant for his future development. He was among the first of German literary men since the Meistersinger days to spring from a commercial environment and parents closely affiliated with political life in what remained of the old free cities. His father's father was a tailor and inn-keeper. His father received a good education, traveled in Italy, attained the distinction of Imperial Councillor, and, though never wealthy, was always in easy circumstances. He married (1748) Katherine Elisabeth Textor (or Weber), and Goethe was the first of their four children, of whom only himself and a sister, Cornelia, survived childhood.

In the pages of Goethe's brilliant autobiographical *Dichtung und Wahrheit*, we seldom see the councillor unbend from his philistine self-satisfaction. But the mother must have been a very remarkable woman, simple, hearty, joyous, affectionate, not highly educated, but with a faculty of rapid assimilation that made her no unworthy companion or correspondent of persons of deeper culture or higher station. The relation of mother and child was ideal. His childhood and youth owed more to her direct influence than to all else besides. She died in 1808. Her *Letters* are published by the Goethe Society (1894). Consult Heinemann, *Goethe's Mutter* (6th ed., Leipzig, 1900).

But Frankfort, too, had a molding influence on him. It was a commercial city, then even more than now the centre of German financial life, of industrialism grafted on an old feudal stock. Old and new in turn and together left their impress on the brilliant and receptive boy. He was precocious, knew something at eight of Greek, Latin, French, and Italian, had acquired from his mother a knack of story-telling and from a toy puppet-show in his nursery a taste for the stage and a stimulus to imagination on which his autobiography lays much stress. He never went regularly to school, and as a child showed consciousness of superiority. The French occupation of Frankfort in 1759 served to polish his French, and still further to cultivate his interest in the stage. He continued to study books and men at Frankfort till he was sixteen, and had had one love affair, from which he recovered with the facile mobility of youth before he went to Leipzig to study law and be fascinated by his host's daughter, Kätchen Schönpkopf.

Leipzig in 1765 was a 'little Paris' in its social and literary ideals. Goethe's letters show that he quickly caught a spirit that accorded well with his nature. He studied little, wrote love songs, interested himself critically in art, learned far more about life than about law, lost his health, and by 1768 had come to look at life on its seamy side, and showed his disillusionment in a drama, *Die Mitschuldigen*, where vice and meanness in manifold variety find it convenient to forgive and forget. This was completed later in Frankfort. Another drama, *Die Laune des Verliebten*, begun in Leipzig, is an embellished version of his relation to Kätchen. It was his author's instinct to put into literary form every experience. All his works, he says, are confessions of his life. These two youthful dramatic essays, both in their matter and their form, show Goethe as a realist. He idealized neither the world nor individual characters.

Goethe returned ill to Frankfort in the autumn of 1768. He remained there sick or convalescent till April, 1770, gaining the while from the works of Lessing a sharpened æsthetic sense and a more balanced judgment. Here, too, he began the scientific studies that were later to round out his fame, and from an amiable acquaintance, Fräulein von Klettenberg, the Beautiful Soul of his *Wilhelm Meister*, he gained some insight into the phenomena of pietistic religious experience and became interested in alchemy and kindred lore, all of which proved useful for *Faust*.

With health restored Goethe went to Strassburg to continue his legal studies. This city, French in government and institutions, German in people and spirit, was a good place in which to complete a cosmopolitan training. Goethe set himself earnestly to work to learn dancing and to

GOETHE
FROM THE PORTRAIT BY CARL STIELER IN THE NEW PINAKOTHEK AT MUNICH

pass his preliminary examinations. He studied also music, art, anatomy, and chemistry. He had begun to work on his dissertation when, in September (1770) he met Herder (q.v.), and in October made the fateful acquaintance of Friederike Brion, the winning daughter of a pastor of Sesenheim. He loved her, and let her love him till her visit to Strassburg broke the idyllic illusion. He would not, perhaps he felt he ought not, ~~to~~ fetter his fortunes and his genius to a yoke so unequal. He left Strassburg (August, 1771), carrying with him a sense of wrong to be atoned. Similar situations haunt his literary work of the next years. The Marie of *Götz*, the Marie of *Clavigo*, the Clärchen of *Egmont*, the Gretchen of *Faust*, spring from this experience, of which he has left a charming and wholly objective account in his autobiographic *Dichtung und Wahrheit*. Friederike died unmarried in 1813. They saw one another without strong emotion on either side in 1779.

Meantime Goethe had formed a close intimacy with Herder, who was confined for months to his room through an operation on the eyes. This was hardly less important to Goethe's literary development than the psychic trial at Sesenheim. They read literary masterpieces and talked of them. Goethe learned through Herder to distrust French classical canons, to appreciate Shakespeare, and to realize that all poetic development must be based on national character if it is to be enduring or beneficent. It was Herder, too, who brought Goethe under the influence of Rousseau, as appears in *Götz*, and especially in *Die Leiden des jungen Werther*. Herder's influence was furthering, even when it was merely restraining, for Goethe was already meditating his *Götz* and even his *Faust*, and both profited by a maturing delay. But Herder finished his work for Goethe at Strassburg. When they met again (1776) Goethe felt he had nothing to gain, and presently it was he who repaid the old debt.

Goethe with his licentiate's degree went back to Frankfurt (1771), and began the nominal practice of law, contributing critical notices to the press, and working on *Götz*, which he intended for a more daring proclamation of the newly claimed liberties of the German stage than Lessing, who had won them, would have ventured or approved. It was the trumpet call of the decade of Storm and Stress (q.v.), in which German young blood held high carnival, and in a blind following of Shakespeare naturally showed more of his faults than of his spirit. *Götz* was a dramatic adaptation of the autobiography of a robber knight of the sixteenth century, striking in its local color and naïveté. In his sturdy independence Goethe saw foreshadowed the reassertion of individualism in the eighteenth century, and he made *Götz*, far more than that knight had made himself, typical of the national revolt against the Roman law and Church. For to Goethe at this time the only progress practicable for Germany lay in the stressing of individuality. But the play as written in 1771 proved too lawless even for his youthful taste. It was first printed in 1840, and remains a curious monument of a period of ferment. It appeared much modified in 1773, struck an answering chord in every heart, and made its as yet unnamed author the literary leader of his time. It gave an immense stimulus to dramatic production, though in casting all thought of the unities to the winds Lessing

thought the 'captivating monstrosity' retarded the development of dramatic art. Goethe may have thought so, too; for he subjected it to a radical revision many years later (1804) for the Weimar stage.

This was a period of manifold activity. To it belong some fine songs, among them the "Wanderer's Sturmlied," orations, essays, reviews, and minor work in much bulk, to which he was stimulated by the shrewd and cautious criticism of Merck, some of whose traits Goethe used for Mephistopheles. This production was interrupted by a new psychic experience. In 1772 Goethe went to Wetzlar to practice law, and fell in love with Charlotte Buff (Lotte), the betrothed of his friend Kestner. From the rather delicate situation thus created Goethe ran away (September 11, 1772), and on his way back to Frankfurt managed to find heart for a flirtation with Maximiliane von Laroehe, who was to be the mother of one of his last adorers, Bettina von Arnim-Brentano, and from home he writes to Charlotte that he 'found a new maiden,' Antoinette Gerock, presently to be succeeded in his facile heart by Anna Mönch, for whom he wrote *Clavigo*, giving literary expression the while to his Wetzlar experiences in *Die Leiden des jungen Werther*, which revealed powers in the German tongue till then unimagined and still unsurpassed. The story, which has been often translated into many languages, is sentimentally morbid and typical of its generation. It was suggested by the suicide of Jerusalem, a student who had formed an attachment for a friend's wife, similar to Goethe's for Lotte. But Goethe, having expressed the mood of his time and age, quickly recovered from it to enter on a period of great creative fecundity, the fruits of which were to appear later in *Faust*, *Prometheus*, *Egmont*, and *Stella*, as well as in many lyrics. Then came his passing betrothal to Lili Schöne-mann (died 1817), a banker's daughter, the nearest that he was ever to come to a love match. For her he wrote some very beautiful songs, and he cherished her memory till death. But for the time they drew apart (September, 1775), and soon after Goethe was invited by Karl August to be one of his Court at Weimar. Meantime Goethe had written *Clavigo* (1774) and many slighter pieces, among them *Götter, Helden und Wieland*, and had found in Merck, an army paymaster at Darmstadt, a friend and a caustically discriminating critic, of much value to him in the discipline of genius. His relations to Lili found expression a little later in *Stella* (1776). In May, 1775, he had made a journey to Switzerland with his friends the Counts Stolberg, and there became intimate with Lavater, whom he had already met.

The coming of Goethe to Weimar is a turning-point in the literary life of Germany. From 1776 Goethe's influence begins to be paramount wherever German is spoken. Weimar was already what it has remained till now, a pleasant residence for the cultured. Goethe made it the Athens of Germany, aided by Karl August and his mother, Amalie, hindered at first by Karl's prim wife, Luise, and by a jealous group of courtiers. Goethe was received in Weimar with an effervescence of enthusiastic appreciation. For a time he led the Court a frolic dance, but presently settled down to be a prudent and blameless man of affairs, and found in this courtly life and the intimate contact with aristocratic society

much to widen his mind and give his judgment a balanced calm. For the next ten years (1776-86) he wrote little save occasional verses and dramatic trifles, of which the chief is *Die Geschwister*. He began work on *Wilhelm Meister* in 1777. Study of natural science, mineralogy, geology, osteology, intercourse with Herder, Wieland, and others, and his interest in the mines at Ilmenau claimed his time, and he made a journey to the mining district of the Harz on their account, bringing back impressions that were of use, not only at Ilmenau, but for his *Faust*. He managed the Court Theatre (with some intermissions, till 1817) and the War Department, superintended the roads and bridges, accompanied Karl August on a journey to Switzerland, from which he gathered literary impressions and above all he maintained a platonic correspondence and intercourse with Charlotte von Stein, a lady of thirty-three, and mother of seven children, who, in making his life 'an enduring resignation,' gave his nature more refinement and self-control for the days of his emancipation. For when he had learned from her what she had to teach, he began to chafe both at this relation and at his Court life, until in 1786 he asked of Karl August unlimited leave of absence, that he might visit Italy. The literary precipitate of this decade is almost wholly lyric or epigrammatic; but he carried across the Alps the uncompleted *Iphigenie* (which in a prose form had been acted in 1779), *Egmont*, *Tasso*, and *Faust*—works not to be finished in the spirit of their inception.

For the Italian journey marks the most important epoch of Goethe's literary and moral development. All the work that follows is radically distinguished from all that went before. Here Goethe found at last his moral balance. From 1788 till his death he went his way among men with the serenity of perfect self-possession. He went first to Verona, then to Padua and Venice, where he stayed two weeks, and then turned southward to Ferrara and across the Apennines to Florence, where he lingered but three hours, so eager was the impetuous traveler to see Rome (October 29, 1786). Here the poetic stream that had long flowed so scantily was unsealed. By mid-January, 1787, he had turned *Iphigenie* into classic iambs, as a first fruit of the new influences, and was so sure that he was on the right track that he determined to do the same service for *Tasso* on a journey to Naples and Sicily, from which he returned in June.

In Rome he now remained nearly a year, perfecting *Iphigenie*, finishing *Egmont*, working on *Tasso* and *Faust*, and prosecuting zealously artistic and botanical studies. (He also lived connubially with a Roman girl, and the connection seems to have revealed to him a joy of life dissociated from the sentimentality that had characterized his previous relations, especially that with Charlotte von Stein. This new moral attitude is reflected in the *Römische Elegien* (1788), an epithalamium addressed to Christiane Vulpius, a young woman of Weimar, with whom he lived quasi-maritally from 1788 till their marriage in 1806, and afterwards till her death (1816), to his own satisfaction, but to the scandal of the ladies of Weimar and the vexation of Bettina von Arnim-Brentano. According to Goethe's correspondence with Christiane, but recently published (*Goethe-Gesellschaft*, Weimar), she was the true and faithful companion of his

after life, loving and beloved. His mother treated her from the first as 'her daughter,' and she earned, after the battle of Jena, the honor of a public recognition of her place by preserving, at the risk of her life, Goethe's house from French marauders.

Goethe brought to Weimar (June 18, 1788) *Iphigenie* and *Egmont*, with *Tasso* almost in its present form, and an essentially altered conception of *Faust*. *Iphigenie* was planned in 1776, and written in prose in 1779. It was a literary projection of his relation to Charlotte von Stein. Orestes recovers a clear mind in the angelic presence of his sister, as Goethe imagined he would do if Charlotte would 'be a sister' to him. Such ethics were unripe and unnatural, and the play lacks action. It was old work made over, and its exquisite versification did not suffice to make it harmonize with his new spirit. There is the same discord of old and new in the prose drama *Egmont*, 'the weak, aristocratic twin brother of Götz' (Hermann Grimm). *Tasso* has more unity of conception and execution, though it is sadly deficient in dramatic action, and, indeed, was not put on the stage for eighteen years after its publication (1790). It, too, in its pre-Italian prose form (1780-81) reflected Goethe 'caught in the snare' of Charlotte von Stein, a situation that in 1786 had ceased to have living interest for him. He concentrated his thought on its form, and made the iambs of *Tasso* so perfect that Schlegel said their very beauty made them unsuited to dramatic dialogue. He also changed the close to conform to his new ethical position.

Goethe's first homogeneous work after his return from Italy was the *Römische Elegien*, in the spirit, he said, of Tibullus, Catullus, and Propertius, the most antique in thought of modern German verse. The frankly naïve sensualism that they exhibit, borne out by his conduct, caused Goethe a temporary loss of social popularity in the 'imperfectly monogamous' society of Weimar, as well as a breach with Frau von Stein. He had outgrown her and the Weimar circle. Even his literary preëminence seemed threatened. In *Götz* and *Werther* he had led his countrymen. Now he had passed beyond them in his deepened æsthetic insight. For a time and until rejuvenated by the friendship of Schiller, he gave his time largely to scientific studies, to which he brought not only an original mind, but almost a seer's vision. In 1784 he had discovered the intermaxillary bone by a method that foreshadowed the science of comparative anatomy. In his essay *Die Metamorphose der Pflanzen*, he became, says Esenbeck, 'the tender father' of a just-born science; his experiments in optics were ingenious and valuable, though his theory of colors was false, and he was first to perceive the vertebrate character of the human skull. Thus, while his contemporary botanists and anatomists were wandering aimlessly or making dry registration of facts, he gave them ideas whose fruitfulness is not yet exhausted. From these studies Goethe was won back to literature by the friendship of Schiller.

Schiller had been living in or near Weimar since 1787, but a strange irony of destiny kept the poets estranged till 1794, though Schiller was drawing, unperceived, into closer sympathy with Goethe's classic ideals. Meantime Goethe's son August was born (December 25, 1789), the only one of several children to reach maturity. This and the storm clouds of the French Revolution led him to defer a visit to Italy, though in 1790 he

went to Venice to meet the Duchess Amalie there, and wrote a group of *Venetianische Epigramme*, that show how his quasi-marriage had helped him to a calmer judgment of Italian culture than that of the *Elegies*. Work in lighter vein now attracted him, *Wilhelm Meister* and the Court Theatre (the management of which he undertook in 1791), till in the summer of 1792 he was summoned by Karl August to join him in the invasion of France that was to culminate in the defeat of the Duke of Brunswick at Valmy. Goethe recorded his six weeks' impressions in his *Kampagne in Frankreich*, and returned to Weimar to find almost ready for his occupancy a mansion presented to him by the Duke, and now, as the home of the Goethe Society and its museum, inseparably connected with his name. The pleasure of this enlarged domesticity is reflected in *Reineke Fuchs*, written in 1793 and published in 1794, the adaptation to social satire of an animal fable that can be traced back to Æsop and to India, though Goethe's immediate model was a German rendering of the mediæval Flemish version of the fable by a certain Willem (about 1250). Out of this comic epic he made, without local or personal allusions, a social and political satire full of ease and vigor, a humorous apotheosis of impudence that has become and is likely to remain one of his most popular poems, though at the time it passed almost unnoticed.

Goethe had met Schiller on several occasions since 1779, and had secured for him a professorship at Jena, though it had seemed to him that the author of *Die Räuber* stood in the way of development of classical taste which, since his return from Italy, Goethe had been anxious to foster. But Schiller was himself developing along these lines, and when they came to understand one another, in 1794, Goethe may well have felt that Schiller, more than any other in Germany, was fitted to appreciate and aid him. He was first to speak of friendship, first to visit his new-found friend. Their intercourse grew constant, especially after Schiller came to Weimar (1799), and was interrupted only by Schiller's death (1805). To Goethe the relation was of stimulating rather than of directing force. He contributed to Schiller's periodical *Die Horen* (1795-97) the *Uebersetzungen deutscher Ausgewanderten* and the *Römische Elegien*, and to the *Musen-almanach* (1796-1800) his share of the *Xenien*—couplets of stinging literary criticism that aroused great excitement and lifelong enmities.

Up to this new influence *Wilhelm Meister's Lernjahre* (1795) was completed, a novel with no definite plot, its purpose being the unfolding of characters drawn from varied social spheres, wonderfully realistic studies involving much ripened worldly wisdom and philosophy. Mignon and Philine are enduring creations, the songs interspersed in the novel are among the most exquisite in any literature, and the analysis of *Hamlet* is a very acute criticism. Some fine ballads and elegies belong to this period also, and it closes with that hymn to the family and masterpiece of classic realism, *Hermann und Dorothea* (1797). Here all is studied from life: there is no idealization, no sentimentality. It was an old story, but instinct with a conservative patriotism in these years of revolution and social upheaval. Other less important works of this period are a realistic drama, *Die natürliche Tochter*, and *Achilleis*, an attempt to continue the *Iliad*.

Some work was done on *Faust* also; but sickness and public cares interrupted it, and the first part was not published till it was included in the first edition of Goethe's *Works* (13 vols., 1808).

Meantime Goethe had lost many friends—Gleim, Klopstock, and Herder in 1803, Schiller in 1805, his mother in 1808. In that year Goethe came in frequent contact with Napoleon at Erfurt. It was about this time, too, that Bettina von Arnim-Brentano conceived that violent attachment for him that appears in her *Goethe's Briefwechsel mit einem Kinde*, which, however, does not represent an actual correspondence; but Bettina could not endure Christiane, and the acquaintance ceased after 1811. In 1809 Goethe published his second novel, *Die Wahlverwandtschaften*, a story of the conflict of love and conjugal duty, with a tragic close. Though now little read, its influence has been great, for it is the starting-point of German psychologic fiction. It has also an autobiographical value. Charlotte is Frau von Stein, and Edward is what Goethe felt he might have become. Ottilie has been thought by some, probably wrongly, to be studied from a young Jena girl, Minna Herzlieb.

From 1811 to 1814 appeared the first three parts of *Dichtung und Wahrheit*, one of the most fascinating autobiographies in any language. It is early memories seen through a long vista of years and under the transforming influence of an artist's eye, beginning with infancy and closing with his coming to Weimar. Meantime the War of Liberation had restored national independence to Germany; but while the fate of his country was changing before his eyes Goethe was studying the Oriental poets and checking the effect of their exuberance by renewed reading of Homer. It was in these years that he wrote in great part the *West-östlicher Divan* (1810), foreign in externals, mysterious and oracular in parts, but aiming to cultivate international sympathies, social and literary, in years of intense Chauvinism. The *Zuleika* poems in the *Divan* have been thought to be addressed in gracefully platonic affection to Marianne Willemer, wife of his congenial host on a journey to the Rhine in 1815, but this is very doubtful. He also undertook at this time some antiquarian studies, standing intentionally aloof from the temporal aspirations of the German people that he might labor more effectively for their intellectual uplifting.

The *West-östlicher Divan* is the last work of Goethe's long connubial life. Christiane had died in 1816. He felt the blow severely, and said that what remained of life to him was but time granted "that he might mourn her loss." His directorship of the Weimar Theatre he gave up in 1817. But the years that remained to him, "testamentary years," he called them, were to yield much of interest. *Wilhelm Meister's Wanderjahre* may indeed seem dreary reading, though it contains many wise pedagogical observations and some episodes that recall the narrative power of Goethe's prime. To these years, also, we owe the Second Part of *Faust*, the necessary complement of the former, with its teaching that men rise by unselfish altruistic effort. Here, as Scherer noticed, Faust chooses, not wealth, but work, and finds in that choice his salvation. ~~Mediator~~ Gretchen brings him to the choice; immediately, Helena, the incarnation of Greek ideals, as though to suggest that beauty is positive, creative, revealing the worth of life, and

freeing Faust at last from the Mephistophelean spirit of negation. So the teaching is the same as that of *Wilhelm Meister*. The scholar, as the poet, passes, in Goethe's conception, from a groping, contemplative, searching æsthetic existence under the spur of negative spirits and ideal models, to active, useful labor. Here is to be found Goethe's philosophy of life, which aims to realize the ideal by the idealization of the real, to correlate action with thought. "The rest of my life may be regarded as a free gift," he said as he sealed the manuscript of this Second Part of *Faust*. "It is now really indifferent what I do, or if I do anything at all." It was his philosophic testament to Germany.

It is to this last period, too, that we owe the Conversations (*Gespräche*) with Eckermann, which have preserved to us much keen criticism of men and things, for during these declining years he continued to be in closest touch with the intellectual movement of his own country and of others. Weimar became a goal of pilgrimage to men of many minds and nations. He seemed to Germans the survivor, almost the last, of a heroic age. Some of these visitors give us glimpses of the old man's life, among them Heine, Thackeray, and his old friend Lottie Kestner. After his wife's death he traveled but little, seldom farther than Jena, lingering especially over places associated with his prime, and toward the last working intermittently, as health permitted, on the annals of his Weimar life. In 1828 Karl August died, followed two years later by Goethe's son August, whose widow, Ottilie, cared for her father-in-law to the end. In the same year (1830) Grand Duchess Luise passed away. So Goethe was left, almost the last of his generation. He died in Weimar March 22, 1832, in his chair, so peacefully that men did not know the hour. Eckermann, who saw his body as it was prepared for burial, noted the deep peace and firmness of the features, the magnificence of the limbs, the broad, strong, and arched chest. Nowhere on the body, he says, was there a trace of wasting. "A perfect man lay in great beauty before me." This body lies now, with that of Schiller, in the ducal mausoleum of Weimar in front of the bronze coffins of the two princely patrons of both, Luise and Karl August.

This is the most completely rounded literary life in history—a life of monumental proportion and yet of perfect symmetry, responsive to all intellectual impulses of art, philosophy, and science, open to every light, yet self-poised and self-controlled till its calm seems Olympian. Goethe is at once the representative and the prophet of the modern spirit, reconciling the antinomies of the ideal and the real in the world-wisdom of his *Faust*.

The literature that has gathered around Goethe would fill a library—indeed, it does so in the Goethe archives at Weimar, whence issue the *Goethe Annual* and the great edition of his works, embracing, also, the *Tagebücher* and *Briefe*, which is now drawing to completeness. Besides this edition may be named Heinemann's annotated edition of the *Werke* which began to appear in 1901 (Leipzig). Of the *Briefe*, there are annotated selections by E. von der Hellen (Stuttgart, 1901 et seq.) and Stein (Berlin, 1902 et seq.), who has edited also the correspondence with Schiller (Leipzig, no date). The correspondence with Frau von Stein is best edited by Schöll (3d ed., Frankfurt, 1889-1900). Eckermann's *Ge-*

sprache are edited with an introduction and notes by Moldenhauer, and, better, by Bartels (Leipzig, 1902). Von Biedermann has also edited Goethe's *Gespräche* (10 vols., Leipzig, 1889-1896).

Of the lives of Goethe, Düntzer's (Leipzig, 1883) is the most complete; Schäfer's, though old (Bremen, 1851, often reëdited), not antiquated; Goedeke's *Goethes Leben und Schriften* (Stuttgart, 1877) is shorter. Popular biographies are those by Heinemann (Leipzig, 1899), Prem (ib., 1900), Witkowski (ib., 1900), and Bielschowsky (Munich, 1902 et seq.).

Among recent studies of Goethe the more significant are: Von Biedermann, *Goethe-Forschungen* (1st series, Frankfurt, 1879; 2d and 3d series, Leipzig, 1886, 1899); Richard M. Meyer, "Goethe," in Bettelheim, *Geisteshelden* (Berlin, 1898); Hermann Grimm, *Goethe-Vorlesungen* (6th ed., Berlin, 1899); Düntzer, *Zur Goethe-Forschung* (1891); Zarncke, *Goetheschriften* (Leipzig, 1897); Bernays, *Der junge Goethe* (Leipzig, 1875); Weissenfels, *Der junge Goethe* (Tübingen, 1899); Menzel, *Der Frankfurter Goethe* (Frankfurt, 1900); Diezmann, *Goethe und die lustige Zeit in Weimar* (2d ed., Weimar, 1901); Burkhardt, *Goethes Unterhaltungen mit dem Kanzler Müller* (1879); Fischer, *Goethe und Napoleon* (Frauenfeld, 1901); Funk, *Goethe und Lavater* (Weimar, 1901); Virchow, *Goethe als Naturforscher* (1861); Sell, *Goethes Stellung zu Religion und Christenthum* (Freiburg, 1899); Vogel, *Goethes Selbstzeugnisse über seine Stellung zur Religion* (Leipzig, 1899); Scherer, *Aufsätze über Goethe* (Berlin, 1900); Bode, *Goethes Aesthetik* (Berlin, 1901). To celebrate the one hundred and fiftieth anniversary of Goethe's birth there was issued *Goethe, eine Biographie in Bildnissen* (Leipzig, 1899), a folio with 166 portraits. See, also, for Goethe's descendants, Von Gerstenbergk, *Ottilie von Goethe und ihre Söhne* (Stuttgart, 1891). Lewes's *Life* (London, 1855) is the best in English. *Wilhelm Meister* has been admirably translated by Carlyle, *Faust* by Bayard Taylor and many others. Some of the lyrics have been rendered masterfully by Longfellow and others, but there is no worthy rendering of the poems or dramas as a whole.

GOETHE, KATHARINA ELISABETH, known as "Frau Rat" (1731-1808). The mother of Johann Wolfgang von Goethe. She was born at Frankfurt-on-the-Main, and was a daughter of Johann Wolfgang Textor, a prominent citizen of that city. At the age of seventeen she was married to Johann Kaspar Goethe, by whom she had four children. She was a woman of exceptional intellect, marked individuality, and a delightfully joyous cast of mind, as evidenced by her letters, and in the frequent references to her found in the works of her son, upon whose intellectual development she undoubtedly exerted a remarkable influence. She was made the heroine of the work by Bettina von Arnim entitled *Dies Buch gehört dem König* (1843), and is one of the central figures of Gutzkow's famous play, *Der Königsleutnant*. Much of the correspondence of Katharina Elisabeth Goethe has been published in *Goethe's Mother, Correspondence of Katharine Elisabeth Goethe with Goethe* (Leipzig, 1889). Her letters to the Duchess Anna Amalia were published at Weimar in 1885. Consult: Keil, *Frau Rat* (Leipzig, 1871); Eric Schmidt, *Charakteristiken* (Berlin, 1886); Heinemann, *Goethes Mutter* (6th ed., Leipzig, 1900).
